Port Integration Module

Block Guide

V01.02

Original Release Date: 03 Feb 2004
Revised: 25 Jun 2004

Motorola, Inc.

Motorola reserves the right to make changes without further notice to any products herein. Motorola makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does Motorola assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation consequential or incidental damages. "Typical" parameters which may be provided in Motorola data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. Motorola does not convey any license under its patent rights nor the rights of others. Motorola products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the Motorola product could create a situation where personal injury or death may occur. Should Buyer purchase or use Motorola products for any such unintended or unauthorized application, Buyer shall indemnify and hold Motorola and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that Motorola was negligent regarding the design or manufacture of the part. Motorola and  are registered trademarks of Motorola, Inc. Motorola, Inc. is an Equal Opportunity/Affirmative Action Employer.

Revision History

Version Number	Revision Date	Effective Date	Author	Description of Changes
V01.00	03 Feb 2004	03 Feb 2004		Initial version.
V01.01	05 Apr 2004	05 Apr 2004		Renamed IVISDATA to IVD. Added I/O description to pin function table. Added info of reduced input threshold capability to specific pins. Added sensitivity to IRQ/XIRQ descriptions. Changed 'Upper/Lower Data Strobe' to '.. Select'.
V01.02	25 Jun 2004	25 Jun 2004		Removed "Controlled Copy" banners.

Table of Contents

Section 1 Introduction

1.1	Overview.	15
1.2	Features	15
1.3	Block diagram.	16

Section 2 External Signal Description

2.1	Overview.	19
2.2	Signal properties.	19

Section 3 Memory Map/Register Definition

3.1	Memory map.	27
3.2	Register descriptions	30
3.2.1	Port A Data Register (PORTA)	31
3.2.2	Port B Data Register (PORTB)	31
3.2.3	Port A Data Direction Register (DDRA)	32
3.2.4	Port B Data Direction Register (DDRB)	32
3.2.5	Port C Data Register (PORTC)	33
3.2.6	Port D Data Register (PORTD)	33
3.2.7	Port C Data Direction Register (DDRC)	34
3.2.8	Port D Data Direction Register (DDRD)	34
3.2.9	Port E Data Register (PORTE)	35
3.2.10	Port E Data Direction Register (DDRE)	36
3.2.11	S12X_EBI ports, BKGD, VREGEN pin Pull-up Control Register (PUCR)	36
3.2.12	S12X_EBI ports Reduced Drive Register (RDRIV)	37
3.2.13	IRQ Control Register (IRQCR)	38
3.2.14	Port K Data Register (PORTK)	39
3.2.15	Port K Data Direction Register (DDRK)	40
3.2.16	Port T Data Register (PTT)	40
3.2.17	Port T Input Register (PTIT)	41
3.2.18	Port T Data Direction Register (DDRT)	41
3.2.19	Port T Reduced Drive Register (RDRT)	42
3.2.20	Port T Pull Device Enable Register (PERT)	42
3.2.21	Port T Polarity Select Register (PPST)	43

3.2.22	Port S Data Register (PTS)	43
3.2.23	Port S Input Register (PTIS)	44
3.2.24	Port S Data Direction Register (DDRS)	44
3.2.25	Port S Reduced Drive Register (RDRS)	45
3.2.26	Port S Pull Device Enable Register (PERS)	45
3.2.27	Port S Polarity Select Register (PPSS)	46
3.2.28	Port S Wired-Or Mode Register (WOMS)	46
3.2.29	Port M Data Register (PTM)	47
3.2.30	Port M Input Register (PTIM)	48
3.2.31	Port M Data Direction Register (DDRM)	49
3.2.32	Port M Reduced Drive Register (RDRM)	49
3.2.33	Port M Pull Device Enable Register (PERM)	50
3.2.34	Port M Polarity Select Register (PPSM)	50
3.2.35	Port M Wired-Or Mode Register (WOMM)	51
3.2.36	Module Routing Register (MODRR)	51
3.2.37	Port P Data Register (PTP)	52
3.2.38	Port P Input Register (PTIP)	53
3.2.39	Port P Data Direction Register (DDRP)	53
3.2.40	Port P Reduced Drive Register (RDRP)	54
3.2.41	Port P Pull Device Enable Register (PERP)	55
3.2.42	Port P Polarity Select Register (PPSP)	55
3.2.43	Port P Interrupt Enable Register (PIEP)	56
3.2.44	Port P Interrupt Flag Register (PIFP)	56
3.2.45	Port H Data Register (PTH)	57
3.2.46	Port H Input Register (PTIH)	57
3.2.47	Port H Data Direction Register (DDRH)	58
3.2.48	Port H Reduced Drive Register (RDRH)	59
3.2.49	Port H Pull Device Enable Register (PERH)	59
3.2.50	Port H Polarity Select Register (PPSH)	60
3.2.51	Port H Interrupt Enable Register (PIEH)	60
3.2.52	Port H Interrupt Flag Register (PIFH)	61
3.2.53	Port J Data Register (PTJ)	61
3.2.54	Port J Input Register (PTIJ)	62
3.2.55	Port J Data Direction Register (DDRJ)	63
3.2.56	Port J Reduced Drive Register (RDRJ)	64
3.2.57	Port J Pull Device Enable Register (PERJ)	64

3.2.58	Port J Polarity Select Register (PPSJ)	65
3.2.59	Port J Interrupt Enable Register (PIEJ)	65
3.2.60	Port J Interrupt Flag Register (PIFJ)	66
3.2.61	Port AD0 Data Register 1 (PT1AD0)	66
3.2.62	Port AD0 Data Direction Register 1 (DDR1AD0)	67
3.2.63	Port AD0 Reduced Drive Register 1 (RDR1AD0)	67
3.2.64	Port AD0 Pull Up Enable Register 1 (PER1AD0)	68
3.2.65	Port AD1 Data Register 0 (PT0AD1)	68
3.2.66	Port AD1 Data Register 1 (PT1AD1)	69
3.2.67	Port AD1 Data Direction Register 0 (DDR0AD1)	69
3.2.68	Port AD1 Data Direction Register 1 (DDR1AD1)	70
3.2.69	Port AD1 Reduced Drive Register 0 (RDR0AD1)	70
3.2.70	Port AD1 Reduced Drive Register 1 (RDR1AD1)	71
3.2.71	Port AD1 Pull Up Enable Register 0 (PER0AD1)	71
3.2.72	Port AD1 Pull Up Enable Register 1 (PER1AD1)	72

Section 4 Functional Description

4.1	General	73
4.2	Registers	73
4.2.1	Data register	73
4.2.2	Input register	74
4.2.3	Data direction register	74
4.2.4	Reduced drive register	74
4.2.5	Pull device enable register	74
4.2.6	Polarity select register	75
4.2.7	Wired-or mode register	75
4.2.8	Interrupt enable register	75
4.2.9	Interrupt flag register	75
4.2.10	Module routing register	75
4.3	Ports	76
4.3.1	BKGD pin	76
4.3.2	Port A, B	76
4.3.3	Port C, D	76
4.3.4	Port E	76
4.3.5	Port K	77
4.3.6	Port T	77

4.3.7	Port S	77
4.3.8	Port M.	77
4.3.9	Port P	77
4.3.10	Port H.	78
4.3.11	Port J	78
4.3.12	Port AD0.	78
4.3.13	Port AD1.	79
4.4	Pin interrupts	79
4.5	Expanded bus pin functions	80
4.6	Low Power Options	82
4.6.1	Run Mode.	82
4.6.2	Wait Mode	82
4.6.3	Stop Mode	82

Section 5 Initialization/Application Information

5.1	Port Data and Data Direction Register writes.	83

Preface

Terminology

Acronyms and Abbreviations	
Logic level "1"	Voltage that corresponds to Boolean true state
Logic level "0"	Voltage that corresponds to Boolean false state
\$	Represents hexadecimal number
x	Represents logic level 'don't care'
expanded modes	Normal Expanded Mode Emulation Single Chip Mode Emulation ExpandedMode Special Test Mode
single-chip modes	Normal Single Chip Mode Special Single Chip Mode
emulation modes	Emulation Single Chip Mode Emulation Expanded Mode
normal modes	Normal Single Chip Mode Normal Expanded Mode
special modes	Special Single Chip Mode Special Test Mode

Section 1 Introduction

1.1 Overview

The S12XD-family Port Integration Module establishes the interface between the peripheral modules including the non-multiplexed External Bus Interface module (S12X_EBI) and the I/O pins for all ports. It controls the electrical pin properties as well as the signal prioritization and multiplexing on shared pins.

This document covers the description of:

- Port A, B used as address output of the S12X_EBI
- Port C, D used as data I/O of the S12X_EBI
- Port E associated with the S12X_EBI control signals and the IRQ, XIRQ interrupt inputs
- Port K associated with address output and control signals of the S12X_EBI
- Port T connected to the Enhanced Capture Timer (ECT) module
- Port S associated with 2 SCI and 1 SPI modules
- Port M associated with 4 MSCAN modules and 1 SCI module
- Port P connected to the PWM and 2 SPI modules - inputs can be used as an external interrupt source
- Port H associated with 2 SCI modules - inputs can be used as an external interrupt source
- Port J associated with 1 MSCAN, 1 SCI and 2 IIC modules - inputs can be used as an external interrupt source
- Port AD0 and AD1 associated with one 8-channel and one 16-channel ATD module

Most I/O pins can be configured by register bits to select data direction and drive strength, to enable and select pull-up or pull-down devices. Interrupts can be enabled on specific pins resulting in status flags.

The I/O's of 2 MSCAN and all 3 SPI modules can be routed from their default location to alternative port pins.

NOTE: *The implementation of the S12XD-family Port Integration Module is device dependent. Therefore some functions are not available on certain derivatives or 112-pin and 80-pin package options.*

1.2 Features

A full-featured S12XD-family Port Integration Module includes these distinctive registers:

- Data and data direction registers for Ports A, B, C, D, E, K, T, S, M, P, H, J, AD0, and AD1 when used as general-purpose I/O
- Control registers to enable/disable pull-device and select pull-ups/pull-downs on Ports T, S, M, P, H, and J on per-pin basis

- Control registers to enable/disable pull-up devices on Ports AD0, and AD1 on per-pin basis
- Single control register to enable/disable pull-ups on Ports A, B, C, D, E, and K on per-port basis and on BKGD pin
- Control registers to enable/disable reduced output drive on Ports T, S, M, P, H, J, AD0, and AD1 on per-pin basis
- Single control register to enable/disable reduced output drive on Ports A, B, C, D, E, and K on per-port basis
- Control registers to enable/disable open-drain (wired-or) mode on Ports S and M
- Control registers to enable/disable pin interrupts on Ports P, H, and J
- Interrupt flag register for pin interrupts on Ports P, H, and J
- Control register to configure $\overline{\text{IRQ}}$ pin operation

A standard port pin has the following minimum features:

- Input/output selection
- 5V output drive with two selectable drive strengths
- 5V digital and analog input
- Input with selectable pull-up or pull-down device

Optional features:

- Open drain for wired-or connections
- Interrupt inputs with glitch filtering
- Reduced input threshold to support low voltage applications

1.3 Block diagram

Figure 1-1 is a block diagram of the PIM_9XDP512.

- Signals shown in **Bold** are not available in 80-pin packages.
- Signals shown in ***Bold-Italics*** are neither available in 112-pin nor in 80-pin packages.
- Shaded labels denote alternative module routing ports.

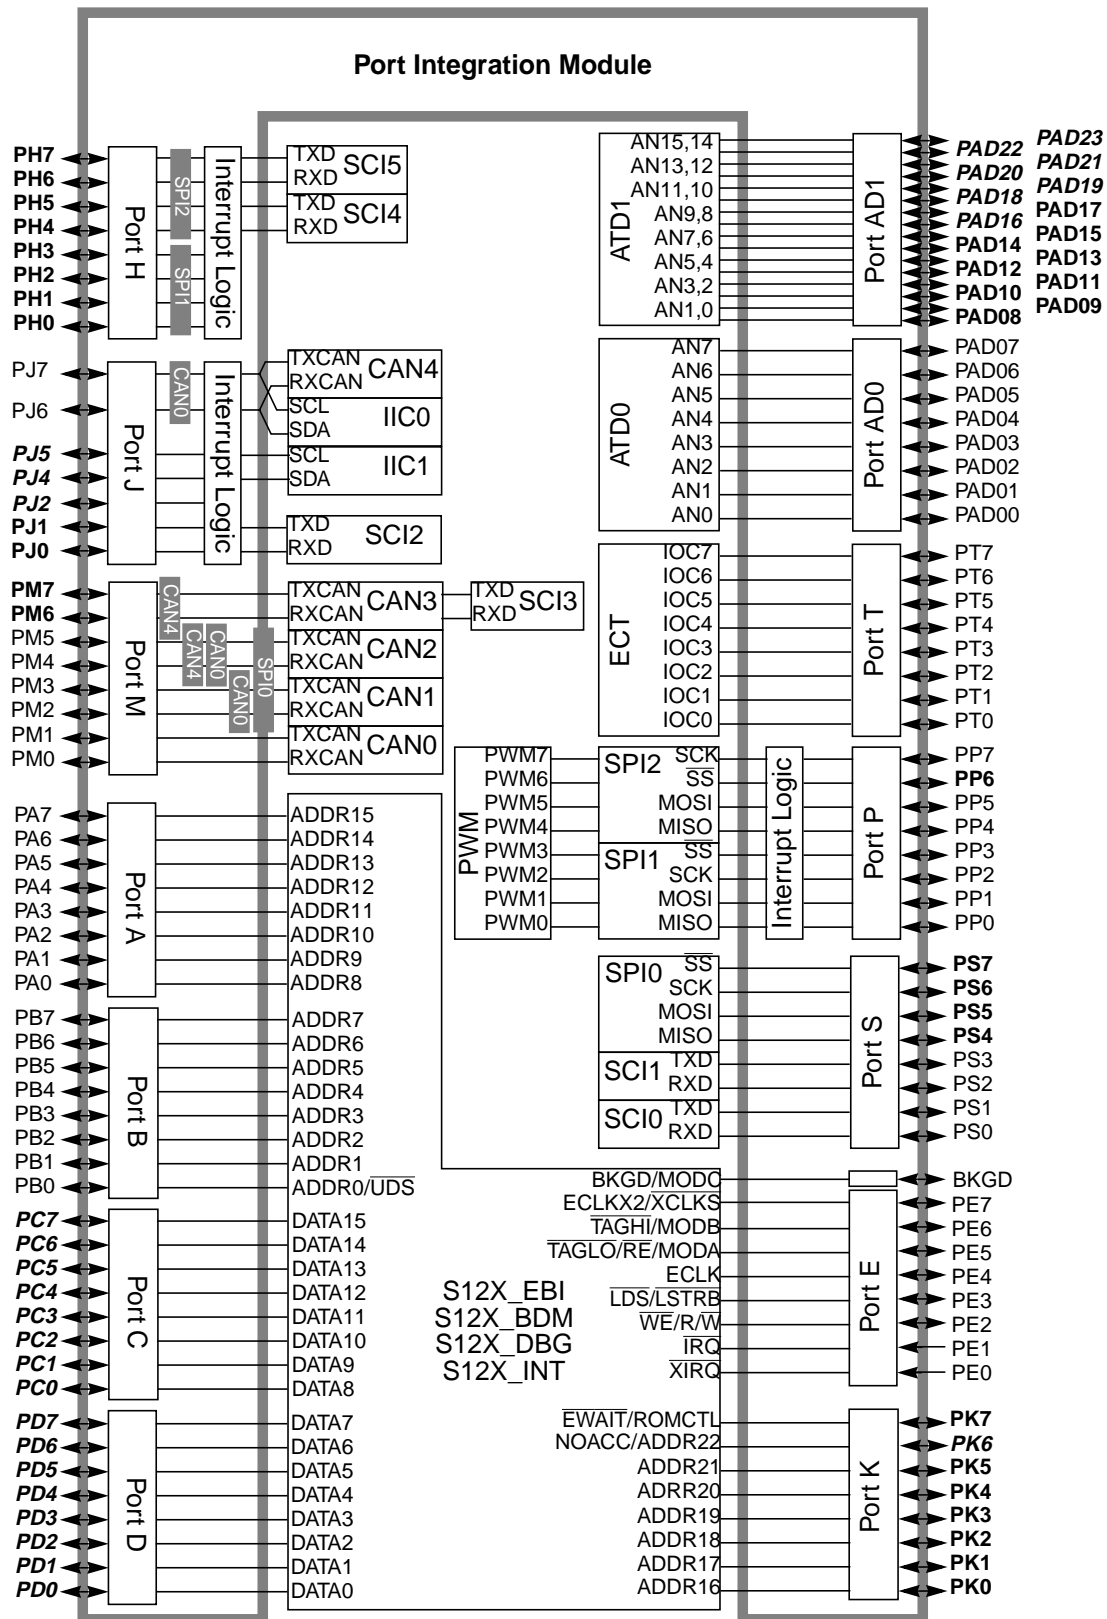

Figure 1-1 PIM_9XDP512 Block Diagram

Section 2 External Signal Description

2.1 Overview

This section lists and describes the signals that do connect off-chip.

2.2 Signal properties

Table 2-1 shows all the pins and their functions that are controlled by the PIM_9XDP512. *Refer to Section 4 Functional Description for the availability of the individual pins in the different package options.*

NOTE: *If there is more than one function associated with a pin, the priority is indicated by the position in the table from top (highest priority) to bottom (lowest priority).*

Table 2-1 Pin Functions and Priorities

Port	Pin Name	Pin Function & Priority	I/O	Description	Pin Function after Reset
-	BKGD	MODC ¹	I	MODC input during RESET	BKGD
		BKGD	I/O	S12X_BDM communication pin	
A	PA[7:0]	ADDR[15:8] mux IVD[15:8] ²	O	High-order external bus address output (multiplexed with IVIS data)	Mode dependent ³
		GPIO	I/O	General-purpose I/O	
B	PB[7:1]	ADDR[7:1] mux IVD[7:1] ²	O	Low-order external bus address output (multiplexed with IVIS data)	Mode dependent ³
		GPIO	I/O	General-purpose I/O	
	PB[0]	ADDR[0] mux IVD0 ²	O	Low-order external bus address output (multiplexed with IVIS data)	
		UDS	O	Upper data strobe	
		GPIO	I/O	General-purpose I/O	
C	PC[7:0]	DATA[15:8]	I/O	High-order bidirectional data input/output Configurable for reduced input threshold	Mode dependent ³
		GPIO	I/O	General-purpose I/O	
D	PB[7:0]	DATA[7:0]	I/O	Low-order bidirectional data input/output Configurable for reduced input threshold	Mode dependent ³
		GPIO	I/O	General-purpose I/O	

Port	Pin Name	Pin Function & Priority	I/O	Description	Pin Function after Reset
E	PE[7]	$\overline{\text{XCLKS}}^1$	I	External clock selection input during $\overline{\text{RESET}}$	Mode dependent ³
		ECLKX2	I	Free-running clock output (ECLK x 2)	
		GPIO	I/O	General-purpose I/O	
	PE[6]	MODB ¹	I	MODB input during $\overline{\text{RESET}}$	
		$\overline{\text{TAGHI}}$	I	Instruction tagging low pin Configurable for reduced input threshold	
		GPIO	I/O	General-purpose I/O	
	PE[5]	MODA ¹	I	MODA input during $\overline{\text{RESET}}$	
		RE	O	Read enable signal	
		$\overline{\text{TAGLO}}$	I	Instruction tagging low pin Configurable for reduced input threshold	
		GPIO	I/O	General-purpose I/O	
	PE[4]	ECLK	O	Free-running clock output	
		GPIO	I/O	General-purpose I/O	
	PE[3]	EROMCTL ¹	I	EROMON bit control input during $\overline{\text{RESET}}$	
		$\overline{\text{LSTRB}}$	O	Low strobe bar output	
		$\overline{\text{LDS}}$	O	Lower data strobe	
		GPIO	I/O	General-purpose I/O	
	PE[2]	$\text{R}/\overline{\text{W}}$	O	Read/write output for external bus	
		$\overline{\text{WE}}$	O	Write enable signal	
		GPIO	I/O	General-purpose I/O	
	PE[1]	$\overline{\text{IRQ}}$	I	Maskable level- or falling edge-sensitive interrupt input	
		GPIO	I/O	General-purpose I/O	
	PE[0]	XIRQ	I	Non-maskable level-sensitive interrupt input	
		GPIO	I/O	General-purpose I/O	

Port	Pin Name	Pin Function & Priority	I/O	Description	Pin Function after Reset
K	PK[7]	ROMCTL ¹		ROMON bit control input during RESET	Mode dependent ³
		EWAIT		External Wait signal Configurable for reduced input threshold	
		GPIO		General-purpose I/O	
	PK[6]	ADDR[22] mux NOACC ²		Extended external bus address output (multiplexed with CPU No Access output)	
		GPIO		General-purpose I/O	
	PK[5:4]	ADDR[21:20]		Extended external bus address output	
		GPIO		General-purpose I/O	
	PK[3]	ADDR[19] mux IQSTAT[3] ²		Extended external bus address output (multiplexed with instruction pipe status bit 3)	
		GPIO		General-purpose I/O	
	PK[2]	ADDR[18] mux IQSTAT[2] ²		Extended external bus address output (multiplexed with instruction pipe status bit 2)	
		GPIO		General-purpose I/O	
	PK[1]	ADDR[17] mux IQSTAT[1] ²		Extended external bus address output (multiplexed with instruction pipe status bit 1)	
		GPIO		General-purpose I/O	
	PK[0]	ADDR[16] mux IQSTAT[0] ²		Extended external bus address output (multiplexed with instruction pipe status bit 0)	
		GPIO		General-purpose I/O	
T	PT[7:0]	IOC[7:0]		Enhanced Capture Timer Channels 7- 0 input/output	GPIO
		GPIO		General-purpose I/O	

Port	Pin Name	Pin Function & Priority	I/O	Description	Pin Function after Reset
S	PS7	$\overline{SS}0$		Serial Peripheral Interface 0 slave select output in master mode, input in slave mode or master mode.	GPIO
		GPIO		General-purpose I/O	
	PS6	SCK0		Serial Peripheral Interface 0 serial clock pin	
		GPIO		General-purpose I/O	
	PS5	MOSI0		Serial Peripheral Interface 0 master out/slave in pin	
		GPIO		General-purpose I/O	
	PS4	MISO0		Serial Peripheral Interface 0 master in/slave out pin	
		GPIO		General-purpose I/O	
	PS3	TXD1		Serial Communication Interface 1 transmit pin	
		GPIO		General-purpose I/O	
	PS2	RXD1		Serial Communication Interface 1 receive pin	
		GPIO		General-purpose I/O	
	PS1	TXD0		Serial Communication Interface 0 transmit pin	
		GPIO		General-purpose I/O	
	PS0	RXD0		Serial Communication Interface 0 receive pin	
		GPIO		General-purpose I/O	

Port	Pin Name	Pin Function & Priority	I/O	Description	Pin Function after Reset
M	PM7	TXCAN3		MSCAN3 transmit pin	GPIO
		TXCAN4		MSCAN4 transmit pin	
		TXD3		Serial Communication Interface 3 transmit pin	
		GPIO		General-purpose I/O	
	PM6	RXCAN3		MSCAN3 receive pin	
		RXCAN4		MSCAN4 receive pin	
		RXD3		Serial Communication Interface 3 receive pin	
		GPIO		General-purpose I/O	
	PM5	TXCAN2		MSCAN2 transmit pin	
		TXCAN0		MSCAN0 transmit pin	
		TXCAN4		MSCAN4 transmit pin	
		SCK0		Serial Peripheral Interface 0 serial clock pin <i>If CAN0 is routed to PM[3:2] the SPI0 can still be used in bidirectional master mode.</i>	
		GPIO		General-purpose I/O	
	PM4	RXCAN2		MSCAN2 receive pin	
		RXCAN0		MSCAN0 receive pin	
		RXCAN4		MSCAN4 receive pin	
		MOSI0		Serial Peripheral Interface 0 master out/slave in pin <i>If CAN0 is routed to PM[3:2] the SPI0 can still be used in bidirectional master mode.</i>	
		GPIO		General-purpose I/O	
	PM3	TXCAN1		MSCAN1 transmit pin	
		TXCAN0		MSCAN0 transmit pin	
		$\overline{SS}0$		Serial Peripheral Interface 0 slave select output in master mode, input for slave mode or master mode.	
		GPIO		General-purpose I/O	
	PM2	RXCAN1		MSCAN1 receive pin	
		RXCAN0		MSCAN0 receive pin	
		MISO0		Serial Peripheral Interface 0 master in/slave out pin	
		GPIO		General-purpose I/O	
	PM1	TXCAN0		MSCAN0 transmit pin	
		GPIO		General-purpose I/O	
	PM0	RXCAN0		MSCAN0 receive pin	
		GPIO		General-purpose I/O	

Port	Pin Name	Pin Function & Priority	I/O	Description	Pin Function after Reset
P	PP7	PWM7		Pulse Width Modulator input/output channel 7	GPIO
		SCK2		Serial Peripheral Interface 2 serial clock pin	
		GPIO/KWP7		General-purpose I/O with interrupt	
	PP6	PWM6		Pulse Width Modulator output channel 6	
		$\overline{SS}2$		Serial Peripheral Interface 2 slave select output in master mode, input for slave mode or master mode.	
		GPIO/KWP6		General-purpose I/O with interrupt	
	PP5	PWM5		Pulse Width Modulator output channel 5

NOTES:

1. Write access not applicable for one or more register bits. *Refer to register description.*

3.2 Register descriptions

The following table summarizes the effect on the various configuration bits, data direction (DDR), output level (IO), reduced drive (RDR), pull enable (PE), pull select (PS) and interrupt enable (IE) for the ports.

The configuration bit PS is used for two purposes:

1. Configure the sensitive interrupt edge (rising or falling), if interrupt is enabled.
2. Select either a pull-up or pull-down device if PE is active.

Table 3-2 Pin Configuration Summary

DDR	IO	RDR	PE	PS ¹	IE ²	Function	Pull Device	Interrupt
0	X	X	0	X	0	Input	Disabled	Disabled
0	X	X	1	0	0	Input	Pull Up	Disabled
0	X	X	1	1	0	Input	Pull Down	Disabled
0	X	X	0	0	1	Input	Disabled	Falling edge
0	X	X	0	1	1	Input	Disabled	Rising edge
0	X	X	1	0	1	Input	Pull Up	Falling edge
0	X	X	1	1	1	Input	Pull Down	Rising edge
1	0	0	X	X	0	Output, full drive to 0	Disabled	Disabled
1	1	0	X	X	0	Output, full drive to 1	Disabled	Disabled
1	0	1	X	X	0	Output, reduced drive to 0	Disabled	Disabled
1	1	1	X	X	0	Output, reduced drive to 1	Disabled	Disabled
1	0	0	X	0	1	Output, full drive to 0	Disabled	Falling edge
1	1	0	X	1	1	Output, full drive to 1	Disabled	Rising edge
1	0	1	X	0	1	Output, reduced drive to 0	Disabled	Falling edge
1	1	1	X	1	1	Output, reduced drive to 1	Disabled	Rising edge

NOTES:

1. Always "0" on Port A, B, C, D, E, K, AD0, and AD1.
2. Applicable only on Port P, H and J.

NOTE: *All register bits in this module are completely synchronous to internal clocks during a register read.*

3.2.1 Port A Data Register (PORTA)

Address Offset: \$0000

	Bit 7	6	5	4	3	2	1	Bit 0
Read:	PA7	PA6	PA5	PA4	PA3	PA2	PA1	PA0
Write:	PA7	PA6	PA5	PA4	PA3	PA2	PA1	PA0
Alt. Func.:	ADDR15 mux IVD15	ADDR14 mux IVD14	ADDR13 mux IVD13	ADDR12 mux IVD12	ADDR11 mux IVD11	ADDR10 mux IVD10	ADDR9 mux IVD9	ADDR8 mux IVD8
Reset:	0	0	0	0	0	0	0	0

= Reserved or unimplemented

Figure 3-1 Port A Data Register (PORTA)

Read: Anytime in single chip single-chip modes.

Write: Anytime.

Port A pins 7 through 0 are associated with address outputs ADDR15 through ADDR8 respectively in expanded modes. When this port is not used for external addresses, these pins can be used as general purpose I/O.

If the data direction bits of the associated I/O pins are set to logic level “1”, a read returns the value of the port register, otherwise the buffered pin input state is read.

3.2.2 Port B Data Register (PORTB)

Address Offset: \$0001

	Bit 7	6	5	4	3	2	1	Bit 0
Read:	PB7	PB6	PB5	PB4	PB3	PB2	PB1	PB0
Write:	PB7	PB6	PB5	PB4	PB3	PB2	PB1	PB0
Alt. Func.:	ADDR7 mux IVD7	ADDR6 mux IVD6	ADDR5 mux IVD5	ADDR4 mux IVD4	ADDR3 mux IVD3	ADDR2 mux IVD2	ADDR1 mux IVD1	ADDR0 mux IVD0 or UDS
Reset:	0	0	0	0	0	0	0	0

= Reserved or unimplemented

Figure 3-2 Port B Data Register (PORTB)

Read: Anytime in single-chip modes.

Write: Anytime.

Port B pins 7 through 1 are associated with address outputs ADDR7 through ADDR1 respectively in expanded modes. Pin 0 is associated with output ADDR0 in emulation modes and special test mode and

with Upper Data Select ($\overline{\text{UDS}}$) in normal expanded mode. When this port is not used for external addresses, these pins can be used as general purpose I/O.

If the data direction bits of the associated I/O pins are set to logic level “1”, a read returns the value of the port register, otherwise the buffered pin input state is read.

3.2.3 Port A Data Direction Register (DDRA)

Figure 3-3 Port A Data Direction Register (DDRA)

Read:Anytime in single-chip modes.

Write:Anytime.

This register controls the data direction for Port A. When Port A is operating as a general purpose I/O port, DDRA determines whether each pin is an input or output. A logic level “1” causes the associated port pin to be an output and a logic level “0” causes the associated pin to be a high-impedance input.

DDRA[7:0] — Data Direction Port A
1 = Associated pin is configured as output.
0 = Associated pin is configured as input.

NOTE: Due to internal synchronization circuits, it can take up to 2 bus clock cycles until the correct value is read on PORTA after changing the DDRA register.

3.2.4 Port B Data Direction Register (DDRB)

Figure 3-4 Port B Data Direction Register (DDRB)

Read:Anytime in single-chip modes.

Write:Anytime.

This register controls the data direction for Port B. When Port B is operating as a general purpose I/O port, DDRB determines whether each pin is an input or output. A logic level “1” causes the associated port pin to be an output and a logic level “0” causes the associated pin to be a high-impedance input.

DDRB[7:0] — Data Direction Port B

1 = Associated pin is configured as output.

0 = Associated pin is configured as input.

NOTE: Due to internal synchronization circuits, it can take up to 2 bus clock cycles until the correct value is read on PORTB after changing the DDRB register.

3.2.5 Port C Data Register (PORTC)

Address Offset: \$0004

	Bit 7	6	5	4	3	2	1	Bit 0
Read:	PC7	PC6	PC5	PC4	PC3	PC2	PC1	PC0
Write:	PC7	PC6	PC5	PC4	PC3	PC2	PC1	PC0
Exp.:	DATA15	DATA14	DATA13	DATA12	DATA11	DATA10	DATA9	DATA8
Reset:	0	0	0	0	0	0	0	0

= Reserved or unimplemented

Figure 3-5 Port C Data Register (PORTC)

Read:Anytime in single-chip modes.

Write:Anytime.

Port C pins 7 through 0 are associated with data I/O lines DATA15 through DATA8 respectively in expanded modes. When this port is not used for external data, these pins can be used as general purpose I/O.

If the data direction bits of the associated I/O pins are set to logic level “1”, a read returns the value of the port register, otherwise the buffered pin input state is read.

3.2.6 Port D Data Register (PORTD)

Address Offset: \$0005

	Bit 7	6	5	4	3	2	1	Bit 0
Read:	PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0
Write:	PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0
Exp.:	DATA7	DATA6	DATA5	DATA4	DATA3	DATA2	DATA1	DATA0
Reset:	0	0	0	0	0	0	0	0

= Reserved or unimplemented

Figure 3-6 Port D Data Register (PORTD)

Read:Anytime in single-chip modes.

Write:Anytime.

Port D pins 7 through 0 are associated with data I/O lines DATA7 through DATA0 respectively in expanded modes. When this port is not used for external data, these pins can be used as general purpose I/O.

If the data direction bits of the associated I/O pins are set to logic level “1”, a read returns the value of the port register, otherwise the buffered pin input state is read.

3.2.7 Port C Data Direction Register (DDRC)

Figure 3-7 Port C Data Direction Register (DDRC)

Read:Anytime in single-chip modes.

Write:Anytime.

This register controls the data direction for Port C. When Port C is operating as a general purpose I/O port, DDRC determines whether each pin is an input or output. A logic level “1” causes the associated port pin to be an output and a logic level “0” causes the associated pin to be a high-impedance input.

DDRC[7:0] — Data Direction Port C
1 = Associated pin is configured as output.
0 = Associated pin is configured as input.

NOTE: Due to internal synchronization circuits, it can take up to 2 bus clock cycles until the correct value is read on PORTC after changing the DDRC register.

3.2.8 Port D Data Direction Register (DDRD)

Figure 3-8 Port D Data Direction Register (DDRD)

Read:Anytime in single-chip modes.

Write:Anytime.

This register controls the data direction for Port D. When Port D is operating as a general purpose I/O port, DDRD determines whether each pin is an input or output. A logic level “1” causes the associated port pin to be an output and a logic level “0” causes the associated pin to be a high-impedance input.

DDRD[7:0] — Data Direction Port D

1 = Associated pin is configured as output.

0 = Associated pin is configured as input.

NOTE: Due to internal synchronization circuits, it can take up to 2 bus clock cycles until the correct value is read on PORTD after changing the DDRD register.

3.2.9 Port E Data Register (PORTE)

Address Offset: \$0008

	Bit 7	6	5	4	3	2	1	Bit 0
Read:	PE7	PE6	PE5	PE4	PE3	PE2	PE1	PE0
Write:								
Alt. Func.:	XCLKS or ECLKX2	MODB or TAGHI	MODA or RE or TAGLO	ECLK	EROMCTL or LSTRB or LDS	R/W or WE	IRQ	XIRQ
Reset:	0	0	0	0	0	0	-1	-1

 = Reserved or unimplemented

NOTES:

1. These registers are reset to zero. Two bus clock cycles after reset release the register values are updated with the associated pin values.

Figure 3-9 Port E Data Register (PORTE)

Read:Anytime in single-chip modes.

Write:Anytime.

Port E bits 7 through 0 are associated with external bus control signals and interrupt inputs. These include mode select (MODB, MODA), E clock, double frequency E clock, Instruction Tagging High and Low (TAGHI, TAGLO), Read/Write (R/W), Read Enable and Write Enable (RE, WE), Lower Data Select (LDS), IRQ, and XIRQ. The External Bus Interface Control Register (EIFCTL) (*refer to S12X_EBI Block Guide*) selects the function of each pin.

When not used for any of these specific functions, Port E pins 7-2 can be used as general purpose I/O and pins 1-0 can be used as general purpose inputs.

If the data direction bits of the associated I/O pins are set to logic level “1”, a read returns the value of the port register, otherwise the buffered pin input state is read.

Pins 6 and 5 are inputs with enabled pull-down devices while RESET pin is low.

Pins 7 and 3 are inputs with enabled pull-up devices while RESET pin is low.

3.2.10 Port E Data Direction Register (DDRE)

Figure 3-10 Port E Data Direction Register (DDRE)

Read:Anytime in single-chip modes.

Write:Anytime.

This register controls the data direction for Port E. When Port E is operating as a general purpose I/O port, DDRE determines whether each pin is an input or output. A logic level “1” causes the associated port pin to be an output and a logic level “0” causes the associated pin to be a high-impedance input.

Port E bit 1 (associated with $\overline{\text{IRQ}}$) and bit 0 (associated with $\overline{\text{XIRQ}}$) cannot be configured as outputs. Port E, bits 1 and 0, can be read regardless of whether the alternate interrupt function is enabled.

DDRE[7:2] Data Direction Port E
1 = Associated pin is configured as output.
0 = Associated pin is configured as input.

NOTE: Due to internal synchronization circuits, it can take up to 2 bus clock cycles until the correct value is read on *PORTE* after changing the *DDRE* register.

3.2.11 S12X_EBI ports, BKGD, VREGEN pin Pull-up Control Register (PUCR)

Figure 3-11 S12X_EBI ports, BKGD, VREGEN pin Pull-up Control Register (PUCR)

Read:Anytime in single-chip modes.

Write:Anytime, except BKPUE which is writable in Special Test Mode only.

This register is used to enable pull-up devices for the associated ports A, B, C, D, E, and K. Pull-up devices are assigned on a per-port basis and apply to any pin in the corresponding port that is currently configured as an input.

PUPKE - Pull-up Port K Enable

- 1 = Enable pull-up devices for Port K input pins.
- 0 = Port K pull-up devices are disabled.

BKPUE - BKGD and VREGEN pin pull-up enable

- 1 = Enable pull-up devices on BKGD and VREGEN pins.
- 0 = BKGD and VREGEN pull-up devices are disabled.

PUPEE - Pull-up Port E Enable

- 1 = Enable pull-up devices for Port E input pins bits 7, 4-0.
- 0 = Port E pull-up devices on bit 7, 4-0 are disabled.

NOTE: Bits 5 and 6 of Port E have pull-down devices which are only enabled during reset. This bit has no effect on these pins.

PUPDE - Pull-up Port D Enable

- 1 = Enable pull-up devices for all Port D input pins.
- 0 = Port D pull-up devices are disabled.

PUPCE - Pull-up Port C Enable

- 1 = Enable pull-up devices for all Port C input pins.
- 0 = Port C pull-up devices are disabled.

PUPBE - Pull-up Port B Enable

- 1 = Enable pull-up devices for all Port B input pins.
- 0 = Port B pull-up devices are disabled.

PUPAE - Pull-up Port A Enable

- 1 = Enable pull-up devices for all Port A input pins.
- 0 = Port A pull-up devices are disabled.

3.2.12 S12X_EBI ports Reduced Drive Register (RDRIV)

Address Offset: \$000D

	Bit 7	6	5	4	3	2	1	Bit 0
Read:	RDPK	0	0	RDPE	RDPD	RDPC	RDPB	RDPA
Write:								
Reset:	0	0	0	0	0	0	0	0

 = Reserved or unimplemented

Figure 3-12 S12X_EBI ports Reduced Drive Register (RDRIV)

Read: Anytime in single-chip modes.

Write:Anytime.

This register is used to select reduced drive for the pins associated with the S12X_EBI ports A, B, C, D, E, and K. If enabled, the pins drive at about 1/6 of the full drive strength. The reduced drive function is independent of which function is being used on a particular pin.

The reduced drive functionality does not take effect on the pins in emulation modes.

RDPK - Reduced Drive of Port K

- 1 = All Port K output pins have reduced drive enabled.
- 0 = All Port K output pins have full drive enabled.

RDPE - Reduced Drive of Port E

- 1 = All Port E output pins have reduced drive enabled.
- 0 = All Port E output pins have full drive enabled.

RDPD - Reduced Drive of Port D

- 1 = All Port D output pins have reduced drive enabled.
- 0 = All Port D output pins have full drive enabled.

RDPC - Reduced Drive of Port C

- 1 = All Port C output pins have reduced drive enabled.
- 0 = All Port C output pins have full drive enabled.

RDPB - Reduced Drive of Port B

- 1 = All Port B output pins have reduced drive enabled.
- 0 = All Port B output pins have full drive enabled.

RDPA - Reduced Drive of Ports A

- 1 = All Port A output pins have reduced drive enabled.
- 0 = All Port A output pins have full drive enabled.

3.2.13 IRQ Control Register (IRQCR)

Figure 3-13 IRQ Control Register (IRQCR)

Read: See individual bit descriptions below.

Write: See individual bit descriptions below.

IRQE - IRQ select edge sensitive only

Special modes: Read or write anytime.

Normal & emulation modes: Read anytime, write once.

1 = $\overline{\text{IRQ}}$ configured to respond only to falling edges. Falling edges on the $\overline{\text{IRQ}}$ pin will be detected anytime $\text{IRQE} = 1$ and will be cleared only upon a reset or the servicing of the $\overline{\text{IRQ}}$ interrupt.

0 = $\overline{\text{IRQ}}$ configured for low level recognition.

IRQEN - External IRQ enable

Read or write anytime.

1 = External $\overline{\text{IRQ}}$ pin is connected to interrupt logic.

0 = External $\overline{\text{IRQ}}$ pin is disconnected from interrupt logic.

3.2.14 Port K Data Register (PORTK)

Address Offset: \$0032

	Bit 7	6	5	4	3	2	1	Bit 0
Read:	PK7	PK6	PK5	PK4	PK3	PK2	PK1	PK0
Write:	PK7	PK6	PK5	PK4	PK3	PK2	PK1	PK0
Alt. Func.:	ROMCTL or $\overline{\text{EWAIT}}$	ADDR22 mux NOACC	ADDR21	ADDR20	ADDR19 mux IQSTAT3	ADDR18 mux IQSTAT2	ADDR17 mux IQSTAT1	ADDR16 mux IQSTAT0
Reset:	0	0	0	0	0	0	0	0

= Reserved or unimplemented

Figure 3-14 Port K Data Register (PORTK)

Read: Anytime in single-chip modes.

Write: Anytime.

Port K pins 7 through 0 are associated with external bus control signals and internal memory expansion emulation pins. These include ADDR22-ADDR16, No-Access (NOACC), External Wait ($\overline{\text{EWAIT}}$) and instruction pipe signals IQSTAT3-IQSTAT0. Bits 6-0 carry the external addresses in all expanded modes. In emulation or special test mode with internal visibility enabled the address is multiplexed with the alternate functions NOACC and IQSTAT on the respective pins. In single-chip modes the port pins can be used as general-purpose I/O.

If the data direction bits of the associated I/O pins are set to logic level “1”, a read returns the value of the port register, otherwise the buffered pin input state is read.

3.2.15 Port K Data Direction Register (DDRK)

Figure 3-15 Port K Data Direction Register (DDRK)

Read:Anytime in single-chip modes.

Write:Anytime.

This register controls the data direction for Port K. When Port K is operating as a general purpose I/O port, DDRK determines whether each pin is an input or output. A logic level “1” causes the associated port pin to be an output and a logic level “0” causes the associated pin to be a high-impedance input.

DDRK[7:0] Data Direction Port K
1 = Associated pin is configured as output.
0 = Associated pin is configured as input.

NOTE: Due to internal synchronization circuits, it can take up to 2 bus clock cycles until the correct value is read on PORTK after changing the DDRK register.

3.2.16 Port T Data Register (PTT)

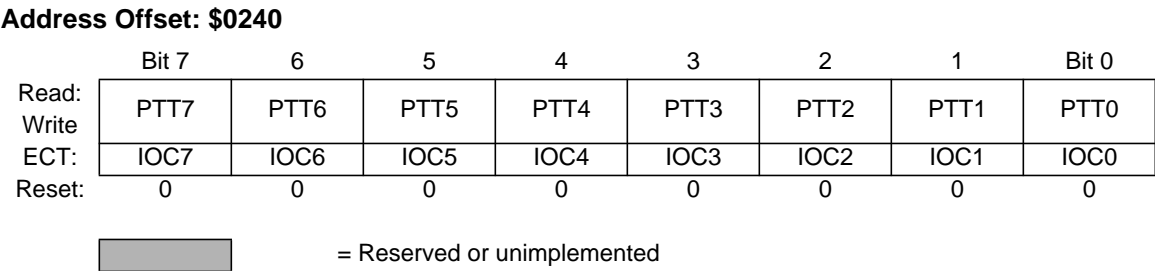

Figure 3-16 Port T Data Register (PTT)

Read:Anytime.

Write:Anytime.

Port T bits 7 through 0 are associated with ECT channels IOC7 through IOC0 (refer to ECT Block Guide). When not used with the ECT, these pins can be used as general purpose I/O.

If the data direction bits of the associated I/O pins are set to logic level “1”, a read returns the value of the port register, otherwise the buffered pin input state is read.

3.2.17 Port T Input Register (PTIT)

Address Offset: \$0241

	Bit 7	6	5	4	3	2	1	Bit 0
Read:	PTIT7	PTIT6	PTIT5	PTIT4	PTIT3	PTIT2	PTIT1	PTIT0
Write:								
Reset ¹ :	-	-	-	-	-	-	-	-

 = Reserved or unimplemented

NOTES:

1. These registers are reset to zero. Two bus clock cycles after reset release the register values are updated with the associated pin values.

Figure 3-17 Port T Input Register (PTIT)

Read:Anytime.

Write:Never, writes to this register have no effect.

This register always reads back the buffered state of the associated pins. This can also be used to detect overload or short circuit conditions on output pins.

3.2.18 Port T Data Direction Register (DDRT)

Address Offset: \$0242

	Bit 7	6	5	4	3	2	1	Bit 0
Read:	DDRT7	DDRT6	DDRT5	DDRT4	DDRT3	DDRT2	DDRT1	DDRT0
Write:								
Reset:	0	0	0	0	0	0	0	0

 = Reserved or unimplemented

Figure 3-18 Port T Data Direction Register (DDRT)

Read:Anytime.

Write:Anytime.

This register configures each Port T pin as either input or output.

The ECT forces the I/O state to be an output for each timer port associated with an enabled output compare. In this case the data direction bits will not change.

The DDRT bits revert to controlling the I/O direction of a pin when the associated timer output compare is disabled.

The timer Input Capture always monitors the state of the pin.

DDRT[7:0] — Data Direction Port T

- 1 = Associated pin is configured as output.
- 0 = Associated pin is configured as input.

NOTE: Due to internal synchronization circuits, it can take up to 2 bus clock cycles until the correct value is read on PTT or PTIT registers, when changing the DDRT register.

3.2.19 Port T Reduced Drive Register (RDRT)

Figure 3-19 Port T Reduced Drive Register (RDRT)

Read:Anytime.

Write:Anytime.

This register configures the drive strength of each Port T output pin as either full or reduced. If the port is used as input this bit is ignored.

RDRT[7:0] — Reduced Drive Port T

- 1 = Associated pin drives at about 1/6 of the full drive strength.
- 0 = Full drive strength at output.

3.2.20 Port T Pull Device Enable Register (PERT)

Figure 3-20 Port T Pull Device Enable Register (PERT)

Read:Anytime.

Write:Anytime.

This register configures whether a pull-up or a pull-down device is activated, if the port is used as input. This bit has no effect if the port is used as output. Out of reset no pull device is enabled.

PERT[7:0] — Pull Device Enable Port T

1 = Either a pull-up or pull-down device is enabled.

0 = Pull-up or pull-down device is disabled.

3.2.21 Port T Polarity Select Register (PPST)

Address Offset: \$0245

	Bit 7	6	5	4	3	2	1	Bit 0

Reset:	0	0	0	0	0	0	0	0

 = Reserved or unimplemented

Figure 3-22 Port S Data Register (PTS)

Read:Anytime.

Write:Anytime.

Port S pins 7 through 4 are associated with the SPI0. The SPI0 pin configuration is determined by several status bits in the SPI0 module. *Refer to SPI Block Guide for details.* When not used with the SPI0, these pins can be used as general purpose I/O.

Port S bits 3 through 0 are associated with the SC11 and SC10. The SCI ports associated with transmit pins 3 and 1 are configured as outputs if the transmitter is enabled. The SCI ports associated with receive pins 2 and 0 are configured as inputs if the receiver is enabled. *Refer to SCI Block Guide for details.* When not used with the SCI, these pins can be used as general purpose I/O.

If the data direction bits of the associated I/O pins are set to logic level “1”, a read returns the value of the port register, otherwise the buffered pin input state is read.

3.2.23 Port S Input Register (PTIS)

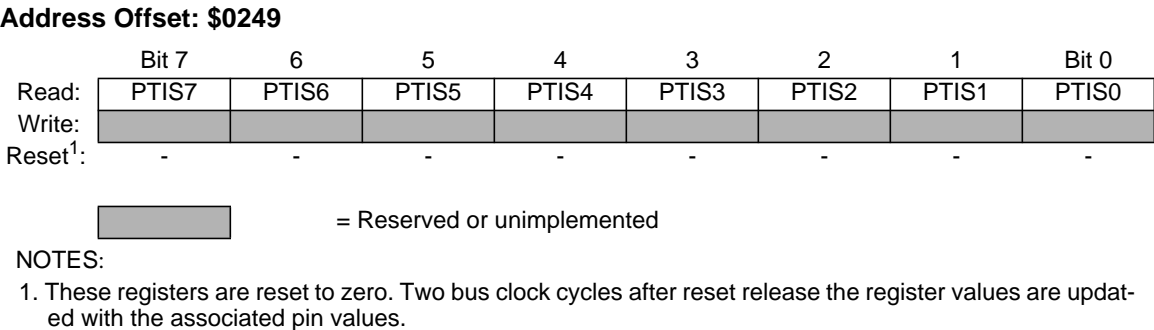

Figure 3-23 Port S Input Register (PTIS)

Read:Anytime.

Write:Never, writes to this register have no effect.

This register always reads back the buffered state of the associated pins. This also can be used to detect overload or short circuit conditions on output pins.

3.2.24 Port S Data Direction Register (DDRS)

Figure 3-24 Port S Data Direction Register (DDRS)

Read:Anytime.

Write:Anytime.

This register configures each Port S pin as either input or output.

If SPI0 is enabled, the SPI0 determines the pin direction. *Refer to SPI Block Guide for details.*

If the associated SCI transmit or receive channel is enabled this register has no effect on the pins. The pin is forced to be an output if a SCI transmit channel is enabled, it is forced to be an input if the SCI receive channel is enabled.

The DDRS bits revert to controlling the I/O direction of a pin when the associated channel is disabled.

DDRS[7:0] — Data Direction Port S

1 = Associated pin is configured as output.

0 = Associated pin is configured as input.

NOTE: Due to internal synchronization circuits, it can take up to 2 bus clock cycles until the correct value is read on PTS or PTIS registers, when changing the DDRS register.

3.2.25 Port S Reduced Drive Register (RDRS)

Address Offset: \$024B

Figure 3-26 Port S Pull Device Enable Register (PERS)

Read:Anytime.

Write:Anytime.

This register configures whether a pull-up or a pull-down device is activated, if the port is used as input or as output in wired-or (open drain) mode. This bit has no effect if the port is used as push-pull output. Out of reset a pull-up device is enabled.

PERS[7:0] — Pull Device Enable Port S

1 = Either a pull-up or pull-down device is enabled.

0 = Pull-up or pull-down device is disabled.

3.2.27 Port S Polarity Select Register (PPSS)

Address Offset: \$024D

Figure 3-27 Port S Polarity Select Register (PPSS)

Read:Anytime.

Write:Anytime.

This register selects whether a pull-down or a pull-up device is connected to the pin.

PPSS[7:0] — Pull Select Port S

1 = A pull-down device is connected to the associated Port S pin, if enabled by the associated bit in register PERS and if the port is used as input.

0 = A pull-up device is connected to the associated Port S pin, if enabled by the associated bit in register PERS and if the port is used as input or as wired-or output.

3.2.28 Port S Wired-Or Mode Register (WOMS)

Address Offset: \$024E

Figure 3-28 Port S Wired-Or Mode Register (WOMS)

Read:Anytime.

Write:Anytime.

This register configures the output pins as wired-or. If enabled the output is driven active low only (open-drain). A logic level of “1” is not driven. It applies also to the SPI and SCI outputs and allows a multipoint connection of several serial modules. These bits have no influence on pins used as inputs.

WOMS[7:0] — Wired-Or Mode Port S

1 = Output buffers operate as open-drain outputs.

0 = Output buffers operate as push-pull outputs.

3.2.29 Port M Data Register (PTM)

Address Offset: \$0250

	Bit 7	6	5	4	3	2	1	Bit 0
Read:	PTM7	PTM6	PTM5	PTM4	PTM3	PTM2	PTM1	PTM0

Write:								
Reset:	0	0	0	0	0	0	0	0

= Reserved or unimplemented

Figure 3-44 Port P Interrupt Flag Register (PIFP)

Read:Anytime.

Write:Anytime.

Each flag is set by an active edge on the associated input pin. This could be a rising or a falling edge based on the state of the PPSP register. To clear this flag, write logic level “1” to the corresponding bit in the PIFP register. Writing a “0” has no effect.

PIFP[7:0] — Interrupt Flags Port P

1 = Active edge on the associated bit has occurred (an interrupt will occur if the associated enable bit is set).

Writing a logic level “1” clears the associated flag.

0 = No active edge pending.

Writing a “0” has no effect.

3.2.45 Port H Data Register (PTH)

Address Offset: \$0260

	Bit 7	6	5	4	3	2	1	Bit 0
Read:	PTH7	PTH6	PTH5	PTH4	PTH3	PTH2	PTH1	PTH0
Write:	PTH7	PTH6	PTH5	PTH4	PTH3	PTH2	PTH1	PTH0
Routed SPI:	$\overline{SS}2$	SCK2	MOSI2	MISO2	$\overline{SS}1$	SCK1	MOSI1	MISO1
SCI:	TXD5	RXD5	TXD4	RXD4				
Reset:	0	0	0	0	0	0	0	0

= Reserved or unimplemented

Figure 3-45 Port H Data Register (PTH)

Read:Anytime.

Write:Anytime.

Port H pins 7 through 0 are associated with the SCI4 and SCI5 as well as the routed SPI1 and SPI2 modules. These pins can be used as general purpose I/O when not used with any of the peripherals.

If the data direction bits of the associated I/O pins are set to logic level “1”, a read returns the value of the port register, otherwise the buffered pin input state is read.

The routed SPI2 function takes precedence over the SCI4 and SCI5 and the general purpose I/O function if the routed SPI2 module is enabled. *Refer to SPI Block Guide for details.*

The routed SPI1 function takes precedence over the general purpose I/O function if the routed SPI1 is enabled. *Refer to SPI Block Guide for details.*

The SCI4 and SCI5 function takes precedence over the general purpose I/O function if the SCI4 or SCI5 is enabled. *Refer to SCI Block Guide for details.*

3.2.46 Port H Input Register (PTIH)

Address Offset: \$0261

	Bit 7	6	5	4	3	2	1	Bit 0

Write:								
Reset ¹ :	-	-	-	-	-	-	-	-

= Reserved or unimplemented

NOTES:

1. These registers are reset to zero. Two bus clock cycles after reset release the register values are updated with the associated pin values.

Figure 3-46 Port H Input Register (PTIH)

Read:Anytime.

Write:Never, writes to this register have no effect.

This register always reads back the buffered state of the associated pins. This can also be used to detect overload or short circuit conditions on output pins.

3.2.47 Port H Data Direction Register (DDRH)

Figure 3-47 Port H Data Direction Register (DDRH)

Read:Anytime.

Write:Anytime.

This register configures each Port H pin as either input or output.

If the associated SCI channel or routed SPI module is enabled this register has no effect on the pins.

The SCI forces the I/O state to be an output for each port line associated with an enabled output (TXD5, TXD4). It also forces the I/O state to be an input for each port line associated with an enabled input (RXD5, RXD4). In those cases the data direction bits will not change.

If a SPI module is enabled, the SPI determines the pin direction. *Refer to SPI Block Guide for details.*

The DDRH bits revert to controlling the I/O direction of a pin when the associated peripheral modules are disabled.

- DDRH[7:0] — Data Direction Port H
- 1 = Associated pin is configured as output.
 - 0 = Associated pin is configured as input.

NOTE: Due to internal synchronization circuits, it can take up to 2 bus clock cycles until the correct value is read on PTH or PTIH registers, when changing the DDRH register.

3.2.48 Port H Reduced Drive Register (RDRH)

Address Offset: \$0263

	Bit 7	6	5	4	3	2	1	Bit 0

Routed CAN0:	TXCAN0	RXCAN0						
Alt. Func.:			CS2	CS0	CS1			
Reset:	0	0	0	0	0	0	0	0

= Reserved or unimplemented

Figure 3-53 Port J Data Register (PTJ)

Read:Anytime.

Write:Anytime.

Port J pins 7 - 4 and 2 - 0 are associated with the CAN4, SCI2, IIC0 and IIC1, the routed CAN0 modules and chip select signals ($\overline{CS0}$, $\overline{CS1}$, $\overline{CS2}$). These pins can be used as general purpose I/O when not used with any of the peripherals.

If the data direction bits of the associated I/O pins are set to logic level “1”, a read returns the value of the port register, otherwise the buffered pin input state is read.

PJ[7:6]

The CAN4 function (TXCAN4 and RXCAN4) takes precedence over the IIC0, the routed CAN0 and the general purpose I/O function if the CAN4 module is enabled.

The IIC0 function (SCL0 and SDA0) takes precedence over the routed CAN0 and the general purpose I/O function if the IIC0 is enabled. If the IIC0 module takes precedence the SDA0 and SCL0 outputs are configured as open drain outputs. *Refer to IIC Block Guide for details.*

The routed CAN0 function (TXCAN0 and RXCAN0) takes precedence over the general purpose I/O function if the routed CAN0 module is enabled. *Refer to MSCAN Block Guide for details.*

PJ[5:4]

The IIC1 function (SCL1 and SDA1) takes precedence over the chip select ($\overline{CS0}$, $\overline{CS2}$) and general purpose I/O function if the IIC1 is enabled. If the IIC1 module takes precedence the SDA1 and SCL1 outputs are configured as open drain outputs. *Refer to IIC Block Guide for details.*

PJ[2]

The chip select function ($\overline{CS1}$) takes precedence over the general purpose I/O.

PJ[1:0]

The SCI2 function takes precedence over the general purpose I/O function if the SCI2 module is enabled. *Refer to SCI Block Guide for details.*

3.2.54 Port J Input Register (PTIJ)

Address Offset: \$0269

1 = Pull-up device is enabled.

0 = Pull-up device is disabled.

Section 4 Functional Description

4.1 General

Each pin except PE0, PE1, and BKGD can act as general purpose I/O. In addition each pin can act as an output from the external bus interface module or a peripheral module or an input to the external bus interface module or a peripheral module.

A set of configuration registers is common to all ports with exceptions in the expanded bus interface and ATD ports (**Table 4-1**). All registers can be written at any time, however a specific configuration might not become active.

Example: Selecting a pull-up device

This device does not become active while the port is used as a push-pull output.

Table 4-1 Register availability per port¹

Port	Data	Data Direction	Input	Reduced Drive	Pull Enable	Polarity Select	Wired-Or Mode	Interrupt Enable	Interrupt Flag

NOTES:

1. Each cell represents one register with individual configuration bits

4.2 Registers

4.2.1 Data register

This register holds the value driven out to the pin if the pin is used as a general purpose I/O.

Writing to this register has only an effect on the pin if the pin is used as general purpose output. When reading this address, the buffered state of the pin is returned if the associated data direction register bit is set to “0”.

If the data direction register bits are set to logic level “1”, the contents of the data register is returned. This is independent of any other configuration (**Figure 4-1**).

4.2.2 Input register

This is a read-only register and always returns the buffered state of the pin (**Figure 4-1**).

4.2.3 Data direction register

This register defines whether the pin is used as an input or an output.

If a peripheral module controls the pin the contents of the data direction register is ignored (**Figure 4-1**).

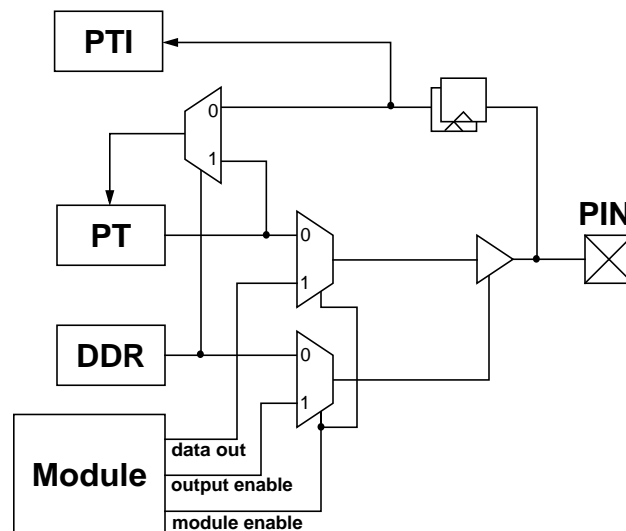

Figure 4-1 Illustration of I/O pin functionality

4.2.4 Reduced drive register

If the pin is used as an output this register allows the configuration of the drive strength.

4.2.5 Pull device enable register

This register turns on a pull-up or pull-down device.

It becomes active only if the pin is used as an input or as a wired-or output.

4.2.6 Polarity select register

This register selects either a pull-up or pull-down device if enabled.

It becomes only active if the pin is used as an input. A pull-up device can be activated if the pin is used as a wired-or output.

If the pin is used as an interrupt input this register selects the active interrupt edge.

4.2.7 Wired-or mode register

If the pin is used as an output this register turns off the active high drive. This allows wired-or type connections of outputs.

4.2.8 Interrupt enable register

If the pin is used as an interrupt input this register serves as a mask to the interrupt flag to enable/disable the interrupt.

4.2.9 Interrupt flag register

If the pin is used as an interrupt input this register holds the interrupt flag after a valid pin event.

4.2.10 Module routing register

This register supports the re-routing of the CAN0, CAN4, SPI0, SPI1, and SPI2 pins to alternative ports. This allows a software re-configuration of the pinouts of the different package options with respect to above peripherals.

NOTE: *The purpose of the Module Routing Register is to provide maximum flexibility for derivatives with a lower number of MSCAN and SPI modules.*

Table 4-2 Module implementations on derivatives

Number of modules	MSCAN modules					SPI modules		
	CAN0	CAN1	CAN2	CAN3	CAN4	SPI0	SPI1	SPI2
5	✓	✓	✓	✓	✓	-	-	-
4	✓	✓	✓	-	✓	-	-	-
3	✓	✓	-	-	✓	✓	✓	✓
2	✓	-	-	-	✓	✓	✓	-
1	✓	-	-	-	-	✓	-	-

4.3 Ports

4.3.1 BKGD pin

The BKGD pin is associated with the S12X_BDM and S12X_EBI modules.

During reset, the BKGD pin is used as MODC input.

4.3.2 Port A, B

Port A pins PA[7:0] and Port B pins PB[7:0] can be used for either general-purpose I/O, or, in 144-pin packages, also with the external bus interface. In this case Port A and Port B are associated with the external address bus outputs ADDR15-ADDR8 and ADDR7-ADDR0, respectively. PB0 is the ADDR0 or \overline{UDS} output.

4.3.3 Port C, D

Port C pins PC[7:0] and Port D pins PD[7:0] can be used for either general-purpose I/O, or, in 144-pin packages, also with the external bus interface. In this case Port C and Port D are associated with the external data bus inputs/outputs DATA15-DATA8 and DATA7-DATA0, respectively.

These pins are configured for reduced input threshold in certain operating modes (refer to S12X_EBI Block Guide).

NOTE: Port C and D are neither available in 112-pin nor in 80-pin packages.

4.3.4 Port E

Port E is associated with the external bus control outputs R/\overline{W} , \overline{LSTRB} , \overline{LDS} and \overline{RE} , the clock outputs ECLK and ECLK2X, as well as with the \overline{TAGHI} , \overline{TAGLO} , MODA and MODB and interrupt inputs \overline{IRQ} and \overline{XIRQ} .

Port E pins PE[7:2] can be used for either general-purpose I/O or with the alternative functions.

Port E pin PE[1] can be used for either general-purpose input or as the level- or falling edge-sensitive \overline{IRQ} interrupt input. \overline{IRQ} will be enabled by setting the IRQEN configuration bit (**3.2.13 IRQ Control Register (IRQCR)**) and clearing the I-bit in the CPU's condition code register. It is inhibited at reset so this pin is initially configured as a simple input with a pull-up.

Port E pin PE[0] can be used for either general-purpose input or as the level-sensitive \overline{XIRQ} interrupt input. \overline{XIRQ} can be enabled by clearing the X-bit in the CPU's condition code register. It is inhibited at reset so this pin is initially configured as a high-impedance input with a pull-up.

Port E pins PE[5] and PE[6] are configured for reduced input threshold in certain modes (refer to S12X_EBI Block Guide).

4.3.5 Port K

Port K pins PK[7:0] can be used for either general-purpose I/O, or, in 144-pin packages, also with the external bus interface. In this case Port K pins PK[6:0] are associated with the external address bus outputs ADDR22-ADDR16 and PK7 is associated to the $\overline{\text{EWAIT}}$ input.

Port K pin PE[7] is configured for reduced input threshold in certain modes (refer to S12X_EBI Block Guide).

NOTE: *Port K is not available in 80-pin packages.
PK[6] is not available in 112-pin packages.*

4.3.6 Port T

This port is associated with the ECT module.

Port T pins PT[7:0] can be used for either general-purpose I/O, or with the channels of the Enhanced Capture Timer.

4.3.7 Port S

This port is associated with SCI0, SCI1 and SPI0.

Port S pins PS[7:0] can be used either for general-purpose I/O, or with the SCI and SPI subsystems.

The SPI0 pins can be re-routed. *Refer to 3.2.36 Module Routing Register (MODRR).*

NOTE: *PS[7:4] are not available in 80-pin packages.*

4.3.8 Port M

This port is associated with the SCI3, CAN4-0 and SPI0.

Port M pins PM[7:0] can be used for either general purpose I/O, or with the CAN, SCI and SPI subsystems.

The CAN0, CAN4 and SPI0 pins can be re-routed. *Refer to 3.2.36 Module Routing Register (MODRR).*

NOTE: *PM[7:6] are not available in 80-pin packages.*

4.3.9 Port P

This port is associated with the PWM, SPI1 and SPI2.

Port P pins PP[7:0] can be used for either general purpose I/O, or with the PWM and SPI subsystems.

The pins are shared between the PWM channels and the SPI1 and SPI2 modules. If the PWM is enabled the pins become PWM output channels with the exception of pin 7 which can be PWM input or output. If

SPI1 or SPI2 are enabled and PWM is disabled, the respective pin configuration is determined by status bits in the SPI modules.

The SPI1 and SPI2 pins can be re-routed. *Refer to **3.2.36 Module Routing Register (MODRR)**.*

Port P offers 8 I/O pins with edge triggered interrupt capability in wired-or fashion (**4.4 Pin interrupts**).

NOTE: *PP[6] is not available in 80-pin packages.*

4.3.10 Port H

This port is associated with the SPI1, SPI2, SCI4, and SCI5.

Port H pins PH[7:0] can be used for either general purpose I/O, or with the SPI and SCI subsystems.

Port H pins can be used with the routed SPI1 and SPI2 modules. *Refer to **3.2.36 Module Routing Register (MODRR)**.*

Port H offers 8 I/O pins with edge triggered interrupt capability (**4.4 Pin interrupts**).

NOTE: *Port H is not available in 80-pin packages.*

4.3.11 Port J

This port is associated with the chip selects $\overline{CS0}$, $\overline{CS1}$, and $\overline{CS2}$ as well as with CAN4, CAN0, IIC1, IIC0, and SCI2.

Port J pins PJ[7:4] and PJ[2:0] can be used for either general purpose I/O, or with the CAN, IIC, or SCI subsystems.

If IIC takes precedence the associated pins become IIC open-drain output pins.

The CAN4 pins can be re-routed. *Refer to **3.2.36 Module Routing Register (MODRR)**.*

Port J pins can be used with the routed CAN0 modules. *Refer to **3.2.36 Module Routing Register (MODRR)**.*

Port J offers 7 I/O pins with edge triggered interrupt capability (**4.4 Pin interrupts**).

NOTE: *PJ[5,4,2] are not available in 112-pin packages.
PJ[5,4,2,1,0] are not available in 80-pin packages.*

4.3.12 Port AD0

This port is associated with the ATD0.

Port AD0 pins PAD07-PAD00 can be used for either general purpose I/O, or with the ATD0 subsystem.

4.3.13 Port AD1

This port is associated with the ATD1.

Port AD1 pins PAD23-PAD08 can be used for either general purpose I/O, or with the ATD1 subsystem.

NOTE: *PAD[23:16] are not available in 112-pin packages.
PAD[23:08] are not available in 80-pin packages.*

4.4 Pin interrupts

Ports P, H and J offer pin interrupt capability. The interrupt enable as well as the sensitivity to rising or falling edges can be individually configured on per-pin basis. All bits/pins in a port share the same interrupt vector. Interrupts can be used with the pins configured as inputs or outputs.

An interrupt is generated when a bit in the port interrupt flag register and its corresponding port interrupt enable bit are both set. The pin interrupt feature is also capable to wake up the CPU when it is in STOP or WAIT mode.

A digital filter on each pin prevents pulses (**Figure 4-3**) shorter than a specified time from generating an interrupt. The minimum time varies over process conditions, temperature and voltage (**Figure 4-2** and **Table 4-3**).

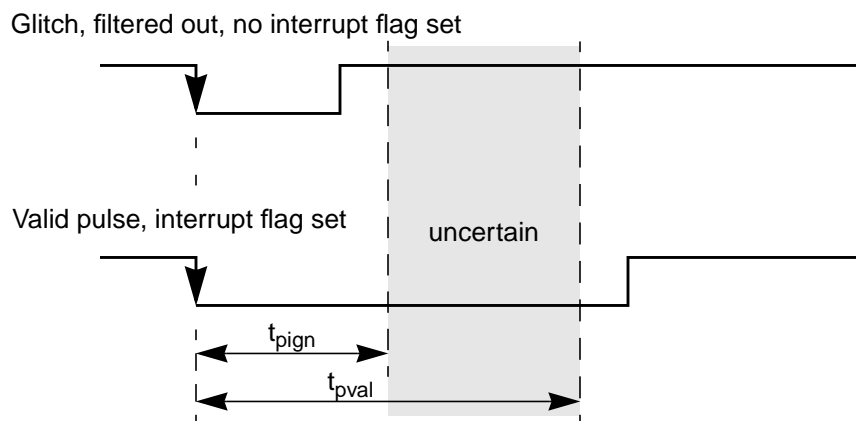

Figure 4-2 Interrupt Glitch Filter on Port P, H and J (PPS=0)

Table 4-3 Pulse Detection Criteria

Pulse	Mode		
	$\overline{\text{STOP}}$		STOP^1
		Unit	
Ignored	$t_{\text{pulse}} \leq 3$	bus clocks	$t_{\text{pulse}} \leq t_{\text{pign}}$
Uncertain	$3 < t_{\text{pulse}} < 4$	bus clocks	$t_{\text{pign}} < t_{\text{pulse}} < t_{\text{pval}}$
Valid	$t_{\text{pulse}} \geq 4$	bus clocks	$t_{\text{pulse}} \geq t_{\text{pval}}$

NOTES:

1. These values include the spread of the oscillator frequency over temperature, voltage and process.

**Figure 4-3 Pulse Illustration**

A valid edge on an input is detected if 4 consecutive samples of a passive level are followed by 4 consecutive samples of an active level directly or indirectly.

The filters are continuously clocked by the bus clock in RUN and WAIT mode. In STOP mode the clock is generated by an RC-oscillator in the Port Integration Module. To maximize current saving the RC oscillator runs only if the following condition is true on any pin individually:

Sample count ≤ 4 and interrupt enabled (PIE=1) and interrupt flag not set (PIF=0).

4.5 Expanded bus pin functions

All peripheral ports T, S, M, P, H, J, AD0 and AD1 start up as general purpose inputs after reset.

Depending on the external mode pin condition, the external bus interface related ports A, B, C, D, E, and K start up as general purpose inputs on reset or are configured for their alternate functions.

Table 4-4 lists the pin functions in relationship with the different operating modes. If two entries per pin are displayed, a “mux” indicates time-multiplexing between the two functions and an “or” means that a configuration bit exists which can be altered after reset to select the respective function (displayed in *italics*). Refer to *S12X_EBI Block Guide* for details.

Table 4-4 Expanded Bus Pin Functions vs. Operating Modes

Pin	single-chip modes		expanded modes				
	Normal Single-Chip	Special Single-Chip	Normal Expanded	Emulation Single-Chip	Emulation Expanded	Special Test	
						IVIS = "0"	IVIS = "1"
PK7	GPIO	GPIO	GPIO or \overline{EWAIT}	GPIO	GPIO or \overline{EWAIT}	GPIO or \overline{EWAIT}	
PK6	GPIO	GPIO	ADDR22	ADDR22 mux NOACC	ADDR22 mux NOACC	ADDR22	ADDR22 mux NOACC

PJ4	GPIO	GPIO	GPIO or $\overline{CS0}^{(1)}$	GPIO	GPIO or $\overline{CS0}^{(1)}$	GPIO or $\overline{CS0}$	
PJ2	GPIO	GPIO	GPIO or $\overline{CS1}$	GPIO	GPIO or $\overline{CS1}$	GPIO or $\overline{CS1}$	

NOTES:

1. Depending on ROMON bit. Refer to Device Guide, S12X_EBI Block Guide and S12X_MMC Block Guide for details.

4.6 Low Power Options

4.6.1 Run Mode

No low power options exist for this module in run mode.

4.6.2 Wait Mode

No low power options exist for this module in wait mode.

4.6.3 Stop Mode

All clocks are stopped. There are asynchronous paths to generate interrupts from STOP on Port P, H and J.

Section 5 Initialization/Application Information

5.1 Port Data and Data Direction Register writes

It is not recommended to write PORTx and DDRx in a word access. When changing the register pins from inputs to outputs, the data may have extra transitions during the write access. Initialize the port data register before enabling the outputs.
