## MT9M021/MT9M031 1/3-inch CMOS Digital Image Sensor

### Description

The MT9M021/MT9M031 from ON Semiconductor is a 1/3-inch CMOS digital image sensor with an active-pixel array of 1280 (H) × 960 (V). It includes sophisticated camera functions such as auto exposure control, windowing, scaling, row skip mode, and both video and single frame modes. It is designed for low light performance and features a global shutter for accurate capture of moving scenes. It is programmable through a simple two-wire serial interface. The MT9M021/MT9M031 produces extraordinarily clear, sharp digital pictures, and its ability to capture both continuous video and single frames makes it the perfect choice for a wide range of applications, including scanning and HD video.

### ORDERING INFORMATION

See detailed ordering and shipping information on page 2 of this data sheet.

### Features

- Superior Low-light Performance
- HD Video (720p60)
- Global Shutter
- Video/Single Frame Mode
- Flexible Row-skip Modes
- On-chip AE and Statistics Engine
- Parallel and Serial Output
- Support for External LED or Flash
- Auto Black Level Calibration
- Context Switching

### Applications

- Scene Processing
- Scanning and Machine Vision
- 720p60 Video Applications

### GENERAL DESCRIPTION

The ON Semiconductor MT9M021/MT9M031 can be operated in its default mode or programmed for frame size, exposure, gain, and other parameters. The default mode output is a full-resolution image at 45 frames per second (fps). It outputs 12-bit raw data, using either the parallel or serial (HiSPi) output ports. The device may be operated in video (master) mode or in frame trigger mode.

FRAME\_VALID and LINE\_VALID signals are output on dedicated pins, along with a synchronized pixel clock.

A dedicated FLASH pin can be programmed to control external LED or flash exposure illumination.

The MT9M021/MT9M031 includes additional features to allow application-specific tuning: windowing, adjustable auto-exposure control, auto black level correction, on-board temperature sensor, and row skip and digital binning modes.

The sensor is designed to operate in a wide temperature range (-30°C to +70°C).

### FUNCTIONAL OVERVIEW

The MT9M021/MT9M031 is a progressive-scan sensor that generates a stream of pixel data at a constant frame rate. It uses an on-chip, phase-locked loop (PLL) that can be optionally enabled to generate all internal clocks from

a single master input clock running between 6 and 50 MHz. The maximum output pixel rate is 74.25 Mp/s, corresponding to a clock rate of 74.25 MHz. Figure 1 shows a block diagram of the sensor.

## MT9M021, MT9M031

**Figure 1. Block Diagram**

User interaction with the sensor is through the two-wire serial bus, which communicates with the array control, analog signal chain, and digital signal chain. The core of the sensor is a 1.2 Mp Active-Pixel Sensor array. The MT9M021/MT9M031 features global shutter technology for accurate capture of moving images. The exposure of the entire array is controlled by programming the integration time by register setting. All rows simultaneously integrate light prior to readout. Once a row has been read, the data

from the columns is sequenced through an analog signal chain (providing offset correction and gain), and then through an analog-to-digital converter (ADC). The output from the ADC is a 12-bit value for each pixel in the array. The ADC output passes through a digital processing signal chain (which provides further data path corrections and applies digital gain). The pixel data are output at a rate of up to 74.25 Mp/s, in parallel to frame and line synchronization signals.

### FEATURES OVERVIEW

The MT9M021/MT9M031 Global Sensor shutter has a wide array of features to enhance functionality and to increase versatility. A summary of features follows. Please refer to the MT9M021/MT9M031 Developer Guide for detailed feature descriptions, register settings, and tuning guidelines and recommendations.

- **Operating Modes**

The MT9M021/MT9M031 works in master (video), trigger (single frame), or Auto Trigger modes. In master mode, the sensor generates the integration and readout timing. In trigger mode, it accepts an external trigger to start exposure, then generates the exposure and readout timing. The exposure time is programmed through the two-wire serial interface for both modes.

NOTE: Trigger mode is not compatible with the HiSPi interface.

- **Window Control**

Configurable window size and blanking times allow a wide range of resolutions and frame rates. Digital binning and skipping modes are supported, as are vertical and horizontal mirror operations.

- **Context Switching**

Context switching may be used to rapidly switch between two sets of register values. Refer to the MT9M021/MT9M031 Developer Guide for a complete set of context switchable registers.

- **Gain**

The MT9M021/MT9M031 Global Shutter sensor can

be configured for analog gain of up to 8x, and digital gain of up to 8x.

- **Automatic Exposure Control**

The integrated automatic exposure control may be used to ensure optimal settings of exposure and gain are computed and updated every other frame. Refer to the MT9M021/MT9M031 Developer Guide for more details.

- **HiSPi**

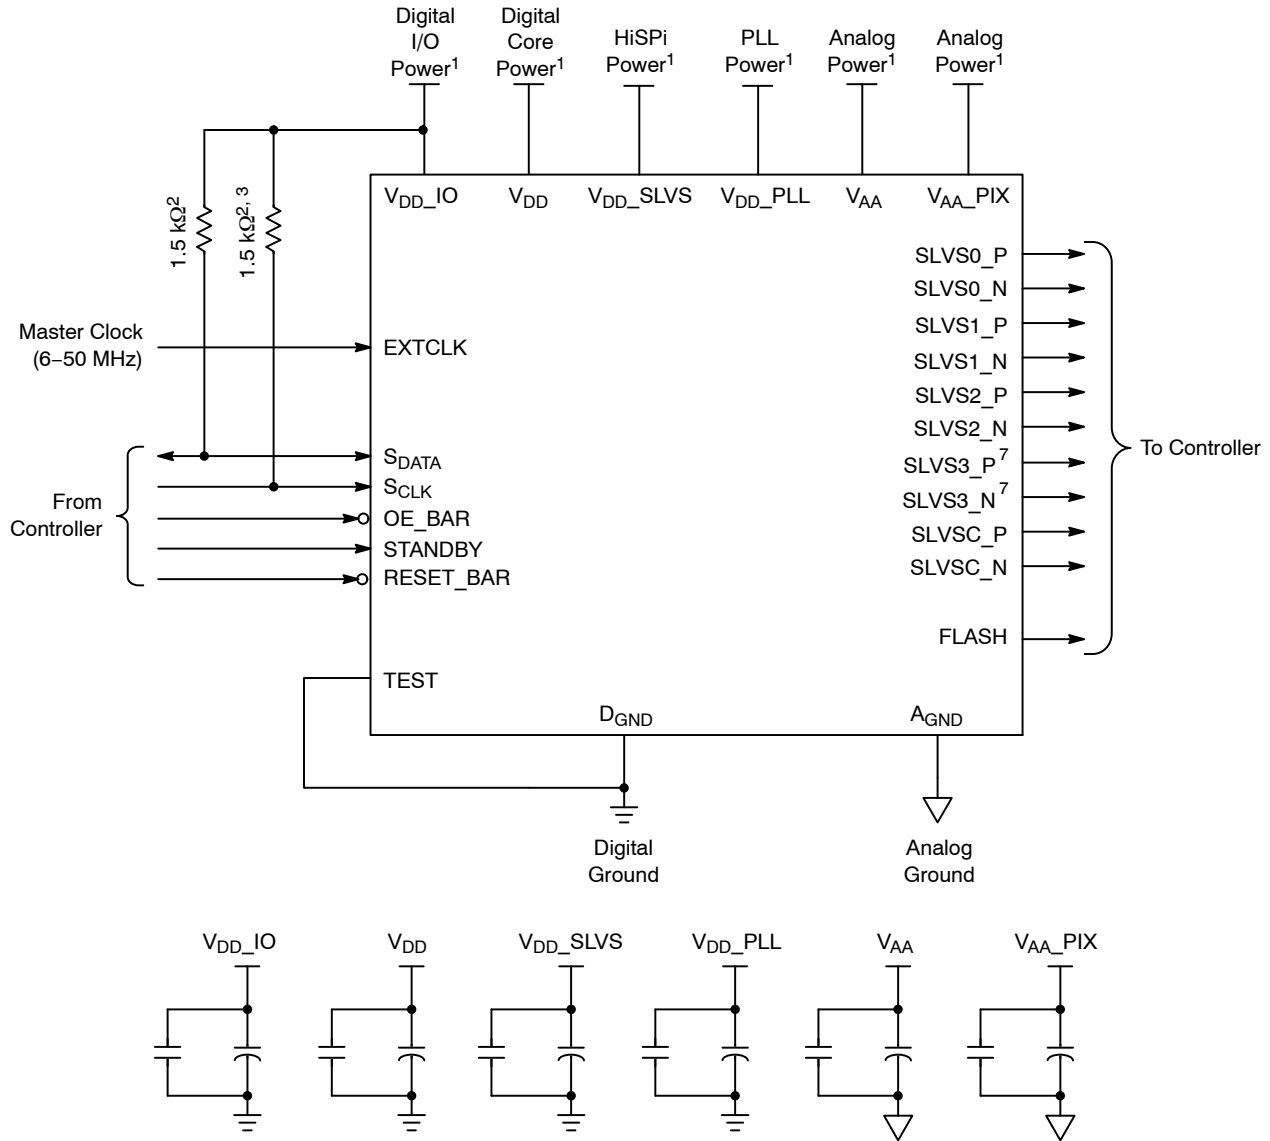

The MT9M021/MT9M031 Global Shutter image sensor supports two or three lanes of Streaming-SP or Packetized-SP protocols of ON Semiconductor's High-Speed Serial Pixel Interface.

## MT9M021, MT9M031

- PLL  
An on chip PLL provides reference clock flexibility and supports spread spectrum sources for improved EMI performance.
  - Reset  
The MT9M021/MT9M031 may be reset by a register write, or by a dedicated input pin.
  - Output Enable  
The MT9M021/MT9M031 output pins may be tri-stated using a dedicated output enable pin.
  - Temperature Sensor  
The temperature sensor is only guaranteed to be functional when the MT9M021/MT9M031 is initially powered-up or is reset at temperatures at or above 0°C.
- Black Level Correction
  - Row Noise Correction
  - Column Correction
  - Test Patterns  
Several test patterns may be enabled for debug purposes. These include a solid color, color bar, fade to grey, and a walking 1s test pattern.

## TYPICAL CONFIGURATION AND PINOUT

### Notes:

1. All power supplies must be adequately decoupled.
2. ON Semiconductor recommends a resistor value of 1.5 kΩ, but a greater value may be used for slower two-wire speed.
3. This pull-up resistor is not required if the controller drives a valid logic level on SCLK at all times.
4. The parallel interface output pads can be left unconnected if the serial output interface is used.
5. ON Semiconductor recommends that 0.1 μF and 10 μF decoupling capacitors for each power supply are mounted as close as possible to the pad. Actual values and results may vary depending on the layout and design considerations. Refer to the MT9M021/MT9M031 demo headboard schematics for circuit recommendations.
6. ON Semiconductor recommends that analog power planes be placed in a manner such that coupling with the digital power planes is minimized.
7. Although 4 serial lanes are shown, the MT9M021/MT9M031 supports only 2- or 3-lane HiSPi.

Unless otherwise stated, the following specifications apply to the following conditions:

$$V_{DD} = 1.8 \text{ V } -0.10/+0.15;$$

$$V_{DD\_IO} = V_{DD\_PLL} = V_{AA} = V_{AA\_PIX} = 2.8 \text{ V } \pm 0.3 \text{ V};$$

$$V_{DD\_SLVS} = 0.4 \text{ V } -0.1/+0.2;$$

$$T_A = -30^\circ\text{C to } +70^\circ\text{C};$$

Output Load = 10 pF;

PIXCLK Frequency = 74.25 MHz;

HiSPi off.

### Two-Wire Serial Register Interface

The electrical characteristics of the two-wire serial register interface ( $S_{CLK}$ ,  $S_{DATA}$ ) are shown in Figure 6 and Table 5.

NOTE: Read sequence: For an 8-bit READ, read waveforms start after WRITE command and register address are issued.

1. This table is based on I<sup>2</sup>C standard (v2.1 January 2000). Philips Semiconductor.
2. Two-wire control is I<sup>2</sup>C-compatible.
3. All values referred to  $V_{IHmin} = 0.9 V_{DD\_IO}$  and  $V_{ILmax} = 0.1 V_{DD\_IO}$  levels. Sensor EXCLK = 27 MHz.
4. A device must internally provide a hold time of at least 300 ns for the S<sub>DATA</sub> signal to bridge the undefined region of the falling edge of S<sub>CLK</sub>.
5. The maximum  $t_{HD;DAT}$  has only to be met if the device does not stretch the LOW period ( $t_{LOW}$ ) of the S<sub>CLK</sub> signal.
6. A Fast-mode I<sup>2</sup>C-bus device can be used in a Standard-mode I<sup>2</sup>C-bus system, but the requirement  $t_{SU;DAT} 250 \text{ ns}$  must then be met. This will automatically be the case if the device does not stretch the LOW period of the S<sub>CLK</sub> signal. If such a device does stretch the LOW period of the S<sub>CLK</sub> signal, it must output the next data bit to the S<sub>DATA</sub> line  $t_r \text{ max} + t_{SU;DAT} = 1000 + 250 = 1250 \text{ ns}$  (according to the Standard-mode I<sup>2</sup>C-bus specification) before the S<sub>CLK</sub> line is released.
7. C<sub>b</sub> = total capacitance of one bus line in pF.

## I/O Timing

By default, the MT9M021/MT9M031 launches pixel data, FV and LV with the falling edge of PIXCLK. The expectation is that the user captures D<sub>OUT</sub>[11:0], FV and LV

using the rising edge of PIXCLK. The launch edge of PIXCLK can be configured in register R0x3028. See Figure 7 and Table 6 for I/O timing (AC) characteristics.

I <sub>OL</sub>	Output LOW Current	At Specified V <sub>OL</sub>	–	–	22	mA

**CAUTION:** Stresses greater than those listed in Table 13 may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

**Table 13. ABSOLUTE MAXIMUM RATINGS**

Symbol	Parameter	Minimum	Maximum	Unit
V <sub>SUPPLY</sub>	Power Supply Voltage (All Supplies)	–0.3	4.5	V

### HiSPi Electrical Specifications

The ON Semiconductor MT9M021/MT9M031 sensor supports SLVS mode only, and does not have a DLL for timing adjustments. Refer to the High-Speed Serial Pixel (HiSPi) Interface Physical Layer Specification v2.00.00 for electrical definitions, specifications, and timing

information. The  $V_{DD\_SLVS}$  supply in this data sheet corresponds to  $V_{DD\_TX}$  in the HiSPi Physical Layer Specification. Similarly,  $V_{DD}$  is equivalent to  $V_{DD\_HiSPi}$  as referenced in the specification. The HiSPi transmitter electrical specifications are listed at 700 MHz.

$t_{DIFFSKEW}$	Mean Differential Skew (Note 6)	–100	–	100	ps

1. One UI is defined as the normalized mean time between one edge and the following edge of the clock.
2. Taken from 0 V crossing point.
3. Also defined with a maximum loading capacitance of 10 pF on any pin. The loading capacitance may also need to be less for higher bitrates so the rise and fall times do not exceed the maximum 0.3 UI.
4. The absolute mean skew between the Clock lane and any Data Lane in the same PHY between any edges.
5. The absolute mean skew between any Clock in one PHY and any Data lane in any other PHY between any edges.
6. Differential skew is defined as the skew between complementary outputs. It is measured as the absolute time between the two complementary edges at mean  $V_{CM}$  point.

**POWER-ON RESET AND STANDBY TIMING**

**Power-Up Sequence**

The recommended power-up sequence for the MT9M021/MT9M031 is shown in Figure 11. The available power supplies ( $V_{DD\_IO}$ ,  $V_{DD}$ ,  $V_{DD\_SLVS}$ ,  $V_{DD\_PLL}$ ,  $V_{AA}$ ,  $V_{AA\_PIX}$ ) must have the separation specified below.

1. Turn on  $V_{DD\_PLL}$  power supply.
2. After 0–10  $\mu$ s, turn on  $V_{AA}$  and  $V_{AA\_PIX}$  power supply.
3. After 0–10  $\mu$ s, turn on  $V_{DD\_IO}$  power supply.
4. After the last power supply is stable, enable EXTCLK.

5. Assert RESET\_BAR for at least 1 ms.
6. Wait 150000 EXTCLKs (for internal initialization into software standby).
7. Configure PLL, output, and image settings to desired values.
8. Wait 1 ms for the PLL to lock.
9. Set streaming mode ( $R0x301a[2] = 1$ ).

Figure 11. Power Up

Table 18. POWER-UP SEQUENCE

Symbol	Definition	Min	Typ	Max	Unit
$t_0$	$V_{DD\_PLL}$ to $V_{AA}/V_{AA\_PIX}$	0	10	–	$\mu$ s
$t_1$	$V_{AA}/V_{AA\_PIX}$ to $V_{DD\_IO}$	0	10	–	$\mu$ s
$t_2$	$V_{DD\_IO}$ to $V_{DD}$	0	10	–	$\mu$ s
$t_3$	$V_{DD}$ to $V_{DD\_SLVS}$	0	10	–	$\mu$ s
$t_x$	Xtal Settle Time	–	30 (Note 1)	–	ms
$t_4$	Hard Reset	1 (Note 2)	–	–	ms
$t_5$	Internal Initialization	150000	–	–	EXTCLKs
$t_6$	PLL Lock Time	1	–	–	ms

1. Xtal settling time is component-dependent, usually taking about 10–100 ms.
2. Hard reset time is the minimum time required after power rails are settled. In a circuit where hard reset is held down by RC circuit, then the RC time must include the all power rail settle time and Xtal settle time.
3. It is critical that  $V_{DD\_PLL}$  is not powered up after the other power supplies. It must be powered before or at least at the same time as the others. If the case happens that  $V_{DD\_PLL}$  is powered after other supplies then the sensor may have functionality issues and will experience high current draw on this supply.

**Power-Down Sequence**

The recommended power-down sequence for the MT9M021/MT9M031 is shown in Figure 12. The available power supplies ( $V_{DD\_IO}$ ,  $V_{DD}$ ,  $V_{DD\_SLVS}$ ,  $V_{DD\_PLL}$ ,  $V_{AA}$ ,  $V_{AA\_PIX}$ ) must have the separation specified below.

1. Disable streaming if output is active by setting standby  $R0x301a[2] = 0$ .
2. The soft standby state is reached after the current row or frame, depending on configuration, has ended.
3. Turn off  $V_{DD\_SLVS}$ .
4. Turn off  $V_{DD}$ .
5. Turn off  $V_{DD\_IO}$ .
6. Turn off  $V_{AA}/V_{AA\_PIX}$ .
7. Turn off  $V_{DD\_PLL}$ .

Figure 12. Power Down

Table 19. POWER-DOWN SEQUENCE

Symbol	Parameter	Min	Typ	Max	Unit
$t_0$	$V_{DD\_SLVS}$ to $V_{DD}$	0	–	–	$\mu s$
$t_1$	$V_{DD}$ to $V_{DD\_IO}$	0	–	–	$\mu s$
$t_2$	$V_{DD\_IO}$ to $V_{AA}/V_{AA\_PIX}$	0	–	–	$\mu s$
$t_3$	$V_{AA}/V_{AA\_PIX}$ to $V_{DD\_PLL}$	0	–	–	$\mu s$
$t_4$	PwrDn until Next PwrUp Time	100	–	–	ms

1.  $t_4$  is required between power down and next power up time; all decoupling caps from regulators must be completely discharged.
