

NCD57000

Isolated High Current IGBT Gate Driver

NCD57000 is a high-current single channel IGBT driver with internal galvanic isolation, designed for high system efficiency and reliability in high power applications. Its features include complementary inputs, open drain FAULT and Ready outputs, active Miller clamp, accurate UVLOs, DESAT protection, soft turn-off at DESAT, and separate high and low (OUTH and OUTL) driver outputs for system design convenience. NCD57000 accommodates both 5 V and 3.3 V signals on the input side and wide bias voltage range on the driver side including negative voltage capability. NCD57000 provides > 5 kVrms (UL1577 rating) galvanic isolation and > 1200 V_{form} (working voltage) capabilities. NCD57000 is available in the wide-body SOIC-16 package with guaranteed 8 mm creepage distance between input and output to fulfill reinforced safety insulation requirements.

Features

- High Current Output (+4/-6 A) at IGBT Miller Plateau Voltages
- Low Output Impedance for Enhanced IGBT Driving
- Short Propagation Delays with Accurate Matching
- Active Miller Clamp to Prevent Spurious Gate Turn-on
- DESAT Protection with Programmable Delay
- Negative Voltage (Down to -9 V) Capability for DESAT
- Soft Turn Off During IGBT Short Circuit
- IGBT Gate Clamping During Short Circuit
- IGBT Gate Active Pull Down
- Tight UVLO Thresholds for Bias Flexibility
- Wide Bias Voltage Range including Negative VEE2
- 3.3 V to 5 V Input Supply Voltage
- Designed for AEC-Q100 Certification
- 5000 V Galvanic Isolation (to meet UL1577 Requirements)
- 1200 V Working Voltage (per VDE0884-11 Requirements)
- High Transient Immunity
- High Electromagnetic Immunity
- These Devices are Pb-Free, Halogen Free and are RoHS Compliant

Typical Applications

- Solar Inverters
- Motor Control
- Uninterruptible Power Supplies (UPS)
- Industrial Power Supplies
- Welding

PIN ASSIGNMENT

ORDERING INFORMATION

See detailed ordering and shipping information on page 7 of this data sheet.

NCD57000

Figure 1. Simplified Block Diagram

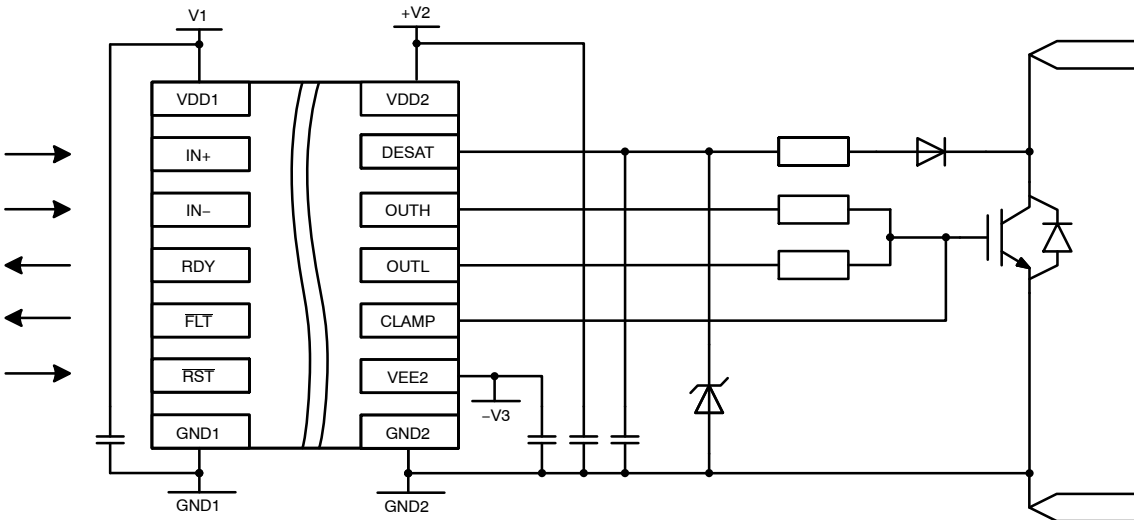

Figure 2. Simplified Application Schematics

NCD57000

PIN DESCRIPTION

Pin Name	No.	I/O	Description
V _{EE2A}	1	Power	Output side negative power supply. A good quality bypassing capacitor is required from these pins to GND2 and should be placed close to the pins for best results. Connect it to GND2 for unipolar supply application.
V _{EE2}	8		
DESAT	2	I/O	Input for detecting the desaturation of IGBT due to a short circuit condition. An internal constant current source I _{DESAT-CHG} charging an external capacitor connected to this pin allows a programmable blanking delay every ON cycle before DESAT fault is processed, thus preventing false triggering. When the DESAT voltage goes up and reaches V _{DESAT-THR} , the output is driven low. Further, the /FLT output is activated, please refer to Figure 5 on page 9. A 5 μs mute time apply to IN+ and IN- once DESAT occurs.
GND2	3	Power	Output side gate drive reference connecting to IGBT emitter or FET source.
OUTH	4	O	Driver high output that provides the appropriate drive voltage and source current to the IGBT/FET gate.
V _{DD2}	5	Power	Output side positive power supply. The operating range for this pin is from UVLO2 to its maximum allowed value. A good quality bypassing capacitor is required from this pin to GND2 and should be placed close to the pins for best results.
OUTL	6	O	Driver low output that provides the appropriate drive voltage and sink current to the IGBT/FET gate. OUTL is actively pulled low during start-up and under Fault conditions.
CLAMP	7	I/O	Provides clamping for the IGBT/FET gate during the off period to protect it from parasitic turn-on. Its internal N FET is turned on when the voltage of this pin falls below V _{EE2} + V _{CLAMP-THR} . It is to be tied directly to IGBT/FET gate with minimum trace length for best results.
GND1A	9	Power	Input side ground reference.
GND1	16		
IN+	10	I	Non inverted gate driver input. It is internally clamped to V _{DD1} and has a pull-down resistor of 50 kΩ to ensure that output is low in the absence of an input signal. A minimum positive going pulse-width is required at IN+ before OUTH/OUTL respond.
IN-	11	I	Inverted gate driver input. It is internally clamped to V _{DD1} and has a pull-up resistor of 50 kΩ to ensure that output is low in the absence of an input signal. A minimum negative going pulse-width is required at IN- before OUTH/OUTL respond.
RDY	12	O	Power good indication output, active high when V _{DD1} and V _{DD2} are both good. There is an internal 50 kΩ pull-up resistor connected to this pin. Multiple of them from different drivers can be "OR"ed together. OUTH/OUTL remain low when RDY is low. Short time delays may apply. See Figure 4 on page 8 for details.
/FLT	13	O	Fault output (active low) that allows communication to the main controller that the driver has encountered a desaturation condition and has deactivated the output. There is an internal 50 kΩ pull-up resistor connected to this pin. Multiple of them from different drivers can be "OR"ed together.
/RST	14	I	Reset input with an internal 50 kΩ pull-up resistor, active low to reset fault latch.
V _{DD1}	15	Power	Input side power supply (3.3 V to 5 V).

NCD57000

ABSOLUTE MAXIMUM RATINGS (Over operating free-air temperature range unless otherwise noted) (Note 1)

Symbol	Parameter	Minimum	Maximum	Unit
V _{DD1} -GND1	Supply voltage, input side	-0.3	6	V
V _{DD2} -GND2	Positive Power Supply, output side	-0.3	25	V
V _{EE2} -GND2	Negative Power Supply, output side	-10	0.3	V
V _{DD2} -V _{EE2} (V _{MAX2})	Differential Power Supply, output side	0	25	V
V _{OUTH}	Positive gate-driver output voltage	V _{EE2} - 0.3	V _{DD2} + 0.3	V
V _{OUTL}	Negative gate-driver output voltage	V _{EE2} - 0.3	V _{DD2} + 0.3	V
I _{PK-SRC}	Gate-driver output sourcing current (maximum pulse width = 10 μs, maximum duty cycle = 0.2%, V _{MAX2} = 23 V)	-	7.8	A
I _{PK-SNK}	Gate-driver output sinking current (maximum pulse width = 10 μs, maximum duty cycle = 0.2%, V _{MAX2} = 23 V)	-	7.1	A
I _{PK-CLAMP}	Clamp sinking current (maximum pulse width = 10 μs, maximum duty cycle = 0.2%, V _{CLAMP} = 2.5 V)	-	2.5	A
t _{CLP}	Maximum Short Circuit Clamping Time (I _{OUTH_CLAMP} = 500 mA)	-	10	μs
V _{LIM} -GND1	Voltage at IN+, IN-, /RST, /FLT, RDY	-0.3	V _{DD1} + 0.3	V
I _{LIM} -GND1	Output current of /FLT, RDY	-	10	mA
V _{DESAT} -GND2	Desat Voltage (Note 2)	-9	V _{DD2} + 0.3	V
V _{CLAMP} -GND2	Clamp Voltage	V _{EE2} - 0.3	V _{DD2} + 0.3	V
P _D	Power Dissipation (Note 3)	-	1400	mW
V _{ISO}	Input to Output Isolation Voltage	-1200	1200	V
T _{J(max)}	Maximum Junction Temperature	-40	150	°C
T _{STG}	Storage Temperature Range	-65	150	°C
ESD _{HBM}	ESD Capability, Human Body Model (Note 4)	-	±2	kV
ESD _{CDM}	ESD Capability, Charged Device Model (Note 4)	-	±2	kV
MSL	Moisture Sensitivity Level	-	2	-
T _{SLD}	Lead Temperature Soldering Reflow, Pb-Free Versions (Note 5)	-	260	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.
2. The minimum value is verified by characterization with a single pulse of 100 mA for 100 μs.
3. The value is estimated for ambient temperature 25°C and junction temperature 150°C, 650 mm², 1 oz copper, 2 surface layers and 2 internal power plane layers. Power dissipation is affected by the PCB design and ambient temperature.
4. This device series incorporates ESD protection and is tested by the following methods:
 ESD Human Body Model tested per AEC-Q100-002 (EIA/JESD22-A114)
 ESD Charged Device Model tested per AEC-Q100-011 (EIA/JESD22-C101)
 Latchup Current Maximum Rating: ≤100 mA per JEDEC standard: JESD78, 25°C
5. For information, please refer to our Soldering and Mounting Techniques Reference Manual, SOLDERM/D.

THERMAL CHARACTERISTICS

Symbol	Parameter	Conditions	Value	Unit
R _{θJA}	Thermal Resistance, Junction-to-Air	100 mm ² , 1 oz Copper, 1 Surface Layer	150	°C/W
		650 mm ² , 1 oz Copper, 2 Surface Layers and 2 Internal Power Plane Layers	84	

NCD57000

OPERATING RANGES (Note 6)

Symbol	Parameter	Min	Max	Unit
V _{DD1} -GND1	Supply voltage, input side	UVLO1	5.5	V
V _{DD2} -GND2	Positive Power Supply, output side	UVLO2	24	V
V _{EE2} -GND2	Negative Power Supply, output side	-10	0	V
V _{DD2} -V _{EE2} (V _{MAX2})	Differential Power Supply, output side	0	24	V
V _{IL}	Low level input voltage at IN+, IN-, /RST	0	0.3 X V _{DD1}	V
V _{IH}	High level input voltage at IN+, IN-, /RST	0.7 X V _{DD1}	V _{DD1}	V
dV _{ISO} /dt	Common Mode Transient Immunity	100	-	kV/μs
T _A	Ambient Temperature	-40	125	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

6. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.

ELECTRICAL CHARACTERISTICS (V_{DD1} = 5 V, V_{DD2} = 15 V, V_{EE2} = -8 V. For typical values T_A = 25°C, for min/max values, T_A is the operating ambient temperature range that applies, unless otherwise noted)
