

Linear Voltage Regulator with Bias Rail, 1.5 A, Very Low Dropout and Programmable Soft-Start

ON Semiconductor®

www.onsemi.com

NCV59748

The NCV59748 is dual-rail very low dropout voltage regulator, capable of providing an output current in excess of 1.5 A with a dropout voltage of 60 mV typ. at full load current. The devices are stable with ceramic and any other type of output capacitor $\geq 2.2 \mu\text{F}$. This series contains adjustable output voltage version with output voltage down to 0.8 V and 0.75 V Fixed Voltage version. Internal protection features consist of built-in thermal shutdown and output current limiting protection. User-programmable Soft-Start and Power-Good pins are available.

The NCV59748 is offered in DFN10 3x3 package, wettable flank options available for Enhanced Optical Inspection.

Features

- Output Current in Excess of 1.5 A
- V_{IN} Range: 0.8 V to 5.5 V
- V_{BIAS} Range: 2.7 V to 5.5 V
- Output Voltage Range: 0.8 V to 3.6 V (Adj), 0.75 V (Fix Volt)
- Dropout Voltage: 60 mV at 1.5 A
- Programmable Soft-Start
- Open Drain Power Good Output
- Fast Transient Response
- Stable with Any Type of Output Capacitor $\geq 2.2 \mu\text{F}$
- Current Limit and Thermal Shutdown Protection
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These are Pb-Free Devices

Applications

- Automotive, Consumer and Industrial Equipment Point of Load Regulation
- FPGA, DSP and Logic Power Supplies
- Switching Power Supply Post Regulation

Table 1. PIN FUNCTION DESCRIPTION

Name	DFN10/DFNW10	Description
IN	1, 2	Unregulated input to the device.
EN	5	Enable pin. Driving this pin high enables the regulator. Driving this pin low puts the regulator into shutdown mode. This pin must not be left floating.
SS	7	Soft-Start pin. A capacitor connected on this pin to ground sets the start-up time. If this pin is left floating, the regulator output soft-start ramp time is typically 200 μ s.
BIAS	4	Bias input voltage for error amplifier, reference, and internal control circuits.
PG	3	Power-Good (PG) is an open-drain, active-high output that indicates the status of V_{OUT} . When V_{OUT} exceeds the PG trip threshold, the PG pin goes into a high-impedance state. When V_{OUT} is below this threshold the pin is driven to a low-impedance state. A pull-up resistor from 10 k Ω to 1 M Ω should be connected from this pin to a supply up to 5.5 V. The supply can be higher than the input voltage. Alternatively, the PG pin can be left floating if output monitoring is not necessary.
FB	8 (Adjustable Voltage device)	This pin is the feedback connection to the center tap of an external resistor divider network that sets the output voltage. This pin must not be left floating.
SNS	8 (Fixed Voltage device)	Output voltage Sensing Input. Connect to Output voltage node on the PCB. This pin must not be left floating.
OUT	9, 10	Regulated output voltage. A small capacitor (total typical capacitance \geq 2.2 μ F, ceramic) is needed from this pin to ground to assure stability.
GND	6	Ground
PAD/TAB		Should be soldered to the ground plane for increased thermal performance.

Table 2. ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Value	Unit
Input Voltage Range	V_{IN}	-0.3 to +6	V
Input Voltage Range	V_{BIAS}	-0.3 to +6	V
Enable Voltage Range	V_{EN}	-0.3 to +6	V
Power-Good Voltage Range	V_{PG}	-0.3 to +6	V
PG Sink Current	I_{PG}	0 to +1.5	mA
SS Pin Voltage Range	V_{SS}	-0.3 to +6	V
Feedback / Sense Pin Voltage Range	$V_{FB/SNS}$	-0.3 to +6	V
Output Voltage Range	V_{OUT}	-0.3 to $(V_{IN} + 0.3) \leq 6$	V
Maximum Output Current	I_{OUT}	Internally Limited	
Output Short Circuit Duration		Indefinite	
Continuous Total Power Dissipation	P_D	See Thermal Characteristics Table and Formula	
Maximum Junction Temperature	T_{JMAX}	+125	°C
Storage Junction Temperature Range	T_{STG}	-55 to +150	°C
ESD Capability, Human Body Model (Note 2)	ESD_{HBM}	2000	V
ESD Capability, Machine Model (Note 2)	ESD_{MM}	200	V

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.
2. This device series incorporates ESD protection and is tested by the following methods:
 ESD Human Body Model tested per AEC-Q100-002
 ESD Machine Model tested per AEC-Q100-003
 Latch-up Current Maximum Rating ± 100 mA per AEC-Q100-004

Table 3. THERMAL CHARACTERISTICS

Rating	Symbol	Value	Unit
Thermal Characteristics, DFN10/DFNW10 3x3 Packages			
Thermal Resistance, Junction-to-Ambient (Note 5)	$R_{\theta JA}$	41.5	°C/W
Thermal Resistance, Junction-to-Case (bottom) (Note 6)	$R_{\theta JC}$	6.6	°C/W

3. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.
4. Thermal data are derived by thermal simulations based on methodology specified in the JEDEC JESD51 series standards. The following assumptions are used in the simulations:
 This data was generated with only a single device at the center of a high-K (2s2p) board with 3 in x 3 in copper area which follows the JEDEC51.7 guidelines.
 - DFN10: The exposed pad is connected to the PCB ground layer through a 3x2 thermal via array. Vias are 0.3 mm diameter, plated. Each of top and bottom copper layers are assumed to have thermal conductivity representing 20% copper coverage.
5. The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a high-K board, following the JEDEC51.7 guidelines with assumptions as above, in an environment described in JESD51-2a.
6. The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the IC exposed pad. Test description can be found in the ANSI SEMI standard G30-88.

Table 4. RECOMMENDED OPERATING CONDITIONS (Note 7)

Rating	Symbol	Min	Max	Unit
Input Voltage	V_{IN}	$V_{OUT} + V_{DO}$	5.5	V
Bias Voltage	V_{BIAS}	2.7	5.5	V
Junction Temperature	T_J	-40	125	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

7. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.

NCV59748

Table 5. ELECTRICAL CHARACTERISTICS (At $V_{EN} = 1.1\text{ V}$, $V_{IN} = V_{OUT} + 0.3\text{ V}$, $C_{BIAS} = 0.1\text{ }\mu\text{F}$, $C_{SS} = 1\text{ nF}$, $C_{IN} = C_{OUT} = 10\text{ }\mu\text{F}$, $I_{OUT} = 50\text{ mA}$, $V_{BIAS} = 5.0\text{ V}$, $T_J = -40^\circ\text{C}$ to $+125^\circ\text{C}$, unless otherwise noted. Typical values are at $T_J = +25^\circ\text{C}$.)

TSD	Thermal Shutdown Temperature	Shutdown, Temperature Increasing	–	+165	–	$^\circ\text{C}$
		Reset, Temperature Decreasing	–	+140	–	

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

8. Adjustable devices tested at V_{REF} ; external resistor tolerance is not taken into account.

9. Dropout is defined as the voltage from the input to V_{OUT} when V_{OUT} is 3% below nominal.

10. 3.25 V is a test condition of this device and can be adjusted by referring to Figure 8.

11. Due to a minimum Bias Pin operating voltage of 2.7 V, V_{BIAS} dropout voltage is not applicable for $V_{OUT} \leq 1.4\text{ V}$.

Adjustable devices tested at $V_{OUT} = 1.5\text{ V}$.

TYPICAL CHARACTERISTICS

At $T_J = +25^\circ\text{C}$, $V_{IN} = V_{OUT(TYP)} + 0.3\text{ V}$, $V_{BIAS} = 5\text{ V}$, $I_{OUT} = 50\text{ mA}$, $V_{EN} = V_{IN}$,
 $C_{IN} = 1\ \mu\text{F}$, $C_{BIAS} = 4.7\ \mu\text{F}$, and $C_{OUT} = 10\ \mu\text{F}$, unless otherwise noted.

Figure 17. Current Limit vs. ($V_{BIAS} - V_{OUT}$)

APPLICATIONS INFORMATION

The NCV59748 dual-rail very low dropout voltage regulator is using NMOS pass transistor for output voltage regulation from V_{IN} voltage. All the low current internal control circuitry is powered from the V_{BIAS} voltage.

The use of an NMOS pass transistor offers several advantages in applications. Unlike a PMOS topology devices, the output capacitor has reduced impact on loop stability. V_{in} to V_{out} operating voltage difference can be very low compared with standard PMOS regulators in very low V_{in} applications.

The NCV59748 offers programmable smooth monotonic start-up. The controlled voltage rising limits the inrush current what is advantageous in applications with large capacitive loads. The Voltage Controlled Soft Start timing is programmable by external C_{SS} capacitor value.

The Enable (EN) input is equipped with internal hysteresis and deglitch filter.

Open Drain type Power Good (PG) output is available for V_{out} monitoring and sequencing of other devices.

NCV59748 Adjustable and Fixed Voltage version is available. Typical application schematic for Adjustable version is shown in Figure 18.

Figure 18. Typical Application Schematics - Adjustable Version

Dropout Voltage

Because of two power supply inputs V_{IN} and V_{BIAS} and one V_{OUT} regulator output, there are two Dropout voltages specified.

The first, the V_{IN} Dropout voltage is the voltage difference ($V_{IN} - V_{OUT}$) when V_{OUT} starts to decrease by percents specified in the Electrical Characteristics table. V_{BIAS} is high enough, specific value is published in the Electrical Characteristics table.

The second, V_{BIAS} dropout voltage is the voltage difference ($V_{BIAS} - V_{OUT}$) when V_{IN} and V_{BIAS} pins are joined together and V_{OUT} starts to decrease.

Input and Output Capacitors

The device is designed to be stable for all available types and values of output capacitors $\geq 2.2 \mu F$. The device is also stable with multiple capacitors in parallel, which can be of any type or value.

In applications where no low input supplies impedance available (PCB inductance in V_{IN} and/or V_{BIAS} inputs as

example), the recommended C_{IN} and C_{BIAS} value is $1 \mu F$ or greater. Ceramic or other low ESR capacitors are recommended. For the best performance all the capacitors should be connected to the NCV59748 respective pins directly in the device PCB copper layer, not through vias having not negligible impedance.

Enable Operation

The enable pin will turn the regulator on or off. The threshold limits are covered in the electrical characteristics table in this data sheet. If the enable function is not to be used then the pin should be connected to V_{IN} or V_{BIAS} .

Output Noise

When the NCV59748 device reaches the end of the Soft-Start cycle, the Soft Start capacitor is switched to serve as a Noise filtering capacitor.

Output Voltage Adjust

The output voltage of Adjustable device can be adjusted from 0.8 V to 3.6 V using resistors divider between the output and the FB input. Recommended resistor values for frequently used voltages can be found in the Table 6.

Programmable Soft-Start

The Soft-Start ramp time depends on the Soft Start charging current I_{SS} , Soft-Start capacitor value C_{SS} and internal reference voltage V_{REF} .

The Soft -Start time can be calculated using following equations:

$$t_{SS} = C_{SS} \times (V_{REF} / I_{SS}) [s, F, V, A]$$

or in more practical units

$$t_{SS} = C_{SS} \times 0.8 V / 0.44 = C_{SS} \times 1.82 \text{ (Adj. device)}$$

and

$$t_{SS} = C_{SS} \times 0.75 V / 0.44 = C_{SS} \times 1.7 \text{ (Fix Volt device)}$$

where

$$t_{SS} = \text{Soft-Start time in milliseconds}$$

$$C_{SS} = \text{Soft-Start capacitor value in nano Farads}$$

Please note $V_{REF} = 0.8 V$ for Adj device and $V_{REF} = 0.75 V$ for the Fixed voltage device.

Capacitor values for Adjustable device and frequently used Soft-Start times can be found in the Table 7.

The maximal recommended value of C_{SS} capacitor is 15 nF. For higher C_{SS} values the capacitor full discharging before new Soft-Start cycle is not guaranteed.

Current Limitation

The internal Current Limitation circuitry allows the device to supply the full nominal current and surges but protects the device against Current Overload or Short.

Thermal Protection

Internal thermal shutdown (TSD) circuitry is provided to protect the integrated circuit in the event that the maximum junction temperature is exceeded. When TSD activated, the

NCV59748

regulator output turns off. When cooling down under the low temperature threshold, device output is activated again. This TSD feature is provided to prevent failures from accidental overheating.

Power Dissipation

The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and the ambient temperature affect the rate of junction temperature rise for the part. For reliable operation junction temperature should be limited to +125°C.

Table 7. CAPACITOR VALUES FOR PROGRAMMING THE SOFT-START TIME (Adjustable Device)

Soft-Start Time	C _{SS}
0.2 ms	Open
0.5 ms	270 pF
1 ms	560 pF
5 ms	2.7 nF
10 ms	5.6 nF
18 ms	10 nF

Table 6. RESISTOR VALUES FOR PROGRAMMING THE OUTPUT VOLTAGE

V _{OUT} (V)	R ₁ (kΩ)	R ₂ (kΩ)
0.8	Short	Open
0.9	0.619	4.99
1.0	1.13	4.53
1.05	1.37	4.33
1.1	1.87	4.99
1.2	2.49	4.99
1.5	4.12	4.75
1.8	3.57	2.87
2.5	3.57	1.69
3.3	3.57	1.15

NOTE: $V_{OUT} = 0.8 \times (1 + R_1/R_2)$
Resistors in the table are standard 1% types
